In 1878 Austria-Hungary took over Sarajevo. In the early 1900s Bosnia and Herzegovina became part of the new country of Yugoslavia.

In 1992 Bosnia and Herzegovina tried to break away from Yugoslavia. A civil war broke out between the Serb, Croat, and Bosniac (Muslim) ethnic groups. Thousands of people in Sarajevo were killed. Much of the city was destroyed.

The war ended in 1995. Bosnia and Herzegovina became an independent country with Sarajevo as its capital. By the early 21st century much of the city had been rebuilt.

Sarcee

The Sarcee are Native Americans of Canada. Their name is sometimes spelled Sarsi. The Sarcee call themselves Tsuu T'ina. They live near the city of Calgary, Alberta. They may once have been part of the Beaver people, who lived to the north.

The Sarcee were Plains Indians. Like other Plains tribes, they hunted bison (buffalo) on horseback on the Great Plains. The Sarcee ate bison meat. They used bison hides to make tepees and clothing. They also gathered wild plants for food.

White traders arrived in Sarcee lands in the late 1700s. By that time the Sarcee lived in what are now southern Alberta

Mountains near Sarajevo, Bosnia and Herzegovina, were the setting for some of the events of the 1984 Winter Olympics.

A Sarccee man wears metal armbands and a headaddress.

and northern Montana. The traders brought guns to the tribes of the area. Then the Sarccee started fighting more often with other tribes. The greatest enemies of the Sarccee were the Cree and the Assiniboin. The Sarccee became allies of the powerful Blackfoot tribe for protection.

Many Sarccee died in war and from diseases brought by the white settlers. There were outbreaks of smallpox in 1836 and 1870, and scarlet fever struck in 1856. In 1877 the weakened Sarccee gave up their lands to the Canadian government. Three years later the Sarccee settled on a reservation near Calgary. At the end of the 20th century there were about 1,000 Sarccee living in Canada.

SARS

SARS, or severe acute respiratory syndrome, is an illness that is similar to influenza, or the flu. In 2003 SARS became an epidemic. An epidemic is an outbreak of a disease that quickly infects a large number of people.

A germ called a virus causes SARS. The symptoms, or signs, of SARS are fever, headache, body aches, and a cough. People with SARS can pass the virus to others by sneezing or coughing.

SARS first appeared in Asia in 2002. By the end of May 2003, SARS had spread to North America, South America, and Europe. More than 8,000 cases of SARS were reported. About 800 people died from the disease. By June 2003 the spread of SARS had been controlled so that it was no longer an epidemic.

Disease, Human • Epidemic • Influenza

Students in a class in Hong Kong wear masks to protect them against the disease known as SARS. The masks keep them from breathing in the germ that causes SARS.

Saskatchewan

Saskatchewan is one of Canada's three Prairie Provinces. It is known for its vast fields of wheat and its valuable minerals. The name Saskatchewan was first used for the province's most important river. It comes from a Cree Indian word meaning "fast-flowing river." The capital of Saskatchewan is Regina.

Geography

Saskatchewan is bordered by Manitoba on the east and Alberta on the west. Manitoba and Alberta are the other two Prairie Provinces. To the north are the Northwest Territories, and to the south are the U.S. states of Montana and North Dakota.

Most of southern Saskatchewan is prairie—flat, treeless plains with some low hills. Wheat fields and cattle ranches cover huge stretches of land. North of the prairie is a rocky region with patches of forest and many lakes. Farther north, the forests get thicker. The extreme north of the province, however, is treeless tundra. Throughout the province winters are long and cold.

People

Most of Saskatchewan's people have European ancestors. People of German origin are the most numerous, followed by people with English, Scottish, Irish, Ukrainian, or French heritage. Residents with American Indian roots make up another large group. The Cree, the Assiniboin, and the Chipewyan are among the major Indian groups.

Nearly two thirds of Saskatchewan's people live in cities or towns. Even so, the province's largest cities are not particularly large. Saskatoon, the largest, has only about 225,000 people in the city and suburbs combined. Regina is slightly smaller. The University of Saskatchewan is in Saskatoon.

Economy

Saskatchewan's economy has always depended on products of the land. The province is a world leader in the production of wheat, and it also grows great amounts of barley, canola, oats, flax, and rye. Ranchers raise cattle and pigs.

Fields of wheat are a common sight in Saskatchewan.

Saskatchewan ranks among Canada's leading provinces in oil, coal, and natural gas production. Its mineral resources also include potash, which is used to make fertilizer, and uranium. Much of the industry in the province is tied to agriculture and mining—for example, meatpacking, flour milling, oil refining, and the production of farm equipment.

Although farming and mining are still very important in Saskatchewan, fewer workers make a living in these activities today than in the past. Many more people now work in the cities, providing services such as sales, government, and health care.

History

American Indians have lived in what is now Saskatchewan for more than 5,000 years. The first Europeans arrived late in the 1600s. They were fur trappers and traders. They worked for the Hudson's Bay Company, an English corporation that controlled a large part of what is now Canada for about 200 years.

In 1869 the newly formed government of Canada bought the Hudson's Bay Company's land, including the Saskatchewan area. In the early 1880s a railroad reached Regina from the east. Farmers soon moved in. The Indians and the Métis (people of mixed Indian and European descent) who lived in the area feared that the newcomers would take their land. In 1885 they rebelled against the Canadian government, which had encouraged the settlers. The rebellion failed, and in the years that followed many more settlers arrived to farm on the prairie. In 1905 the Canadian government created the province of Saskatchewan.

The population of the province grew rapidly in the first decades of the 1900s. In the mid-1900s Saskatchewan's government introduced many new programs. It was the first government in North America to pay for medical care for all its people.

Satellite

A satellite is a small object that orbits, or revolves around, a larger object in space. Satellites can be natural or artificial (made by people). All the planets in the solar system except Mercury and Venus have natural satellites. Earth's Moon is one example. Artificial satellites are sent into space to gather information. Most are launched into space by rockets.

The first artificial satellite was Sputnik 1. The Soviet Union launched it into orbit around Earth in 1957. The first successful U.S. satellite was Explorer 1. It was launched in 1958. Now dozens of new satellites are put into space every year. They orbit around Earth as well as the Moon, Venus, Mars, Jupiter, and other bodies.

Artificial satellites have many purposes. Scientific satellites collect information about space. The Hubble Space Telescope is a scientific satellite that orbits around Earth. It sees the sky more clearly than telescopes on the ground. Communications satellites help send telephone calls, radio and television programs, and computer information all over the world. Airplanes, ships, and cars with special equipment can use information from satellites to find the way from place to place. Militaries use satellites for spying. Satellites are used in weather forecasting, too.

A space station is a special kind of satellite used by astronauts. Astronauts can live on a space station for months

Saturn

Saturn is one of the planets that orbit, or travel around, the sun in the solar system. It is the second largest planet in the solar system, after Jupiter. It is known for its beautiful rings. The planet was named for the ancient Roman god of agriculture.

Saturn is the sixth planet from the sun. It travels around the sun at an average distance of about 885 million miles (1.4 billion kilometers).

Physical Features

Saturn is huge. Its diameter, or distance through its center, is about 74,900 miles

(120,600 kilometers). That is nine times larger than Earth's diameter. However, Saturn is very light for its size. It would float if placed in water.

Saturn is a kind of planet called a gas giant. It is made up mostly of gases, mainly hydrogen and helium. What looks like a solid surface in photographs is actually a layer of clouds. Under Saturn's huge layers of gases is a smaller area of hot liquid metal. At its center the planet probably has a hot, rocky core.

A system of very thin rings surrounds Saturn. The rings extend thousands of miles out from the planet. They are made up mostly of pieces of water ice and dust.

Orbit and Spin

Like all planets, Saturn has two types of motion: orbit and spin. It takes Saturn about 29 Earth years to complete one orbit, or path around the sun. In other words, a year on Saturn is about 29 Earth years.

Saturn spins very quickly about its center. It takes the planet less than 11 hours to complete one rotation. That is the length of a day on Saturn.

Moons

Saturn has eight major moons and many small ones. Altogether more than 40 moons orbit the planet. Its largest moon is Titan. Titan's atmosphere, or the layer of gases surrounding it, is very thick. Titan is the only moon in the solar system known to have a thick atmosphere and clouds. Other major moons include

Two of Saturn's moons can be seen as small dots to the left of the planet.

Dione, Tethys, Rhea, Hyperion, and Mimas.

Observation and Exploration

People have observed Saturn since ancient times because it can be seen from Earth without a telescope. In the 1970s the United States sent three unmanned spacecraft—named Pioneer 11, Voyager 1, and Voyager 2—to Saturn. They were the first spacecraft to fly by the planet.

An unmanned U.S. spacecraft named Cassini began orbiting Saturn in 2004. It dropped a European spacecraft called Huygens onto Titan. Huygens was the first spacecraft to land on a moon other than Earth's moon.

Saudi Arabia

Saudi Arabia is the largest country in the Middle East. It is also the largest producer of oil in the world. Saudi Arabia contains the two holiest cities in the religion of Islam. Its capital is Riyadh.

Geography

Saudi Arabia covers four fifths of the Arabian Peninsula, a large triangle of land between Africa and Asia. Saudi Arabia shares borders with Jordan, Iraq, Kuwait, Qatar, the United Arab Emirates, Oman, and Yemen. The Red Sea runs along the western border. The Persian Gulf lies to the east.

Almost all of Saudi Arabia's land is flat desert. The Rub' al-Khali desert in the southeast is the longest stretch of sand in the world. Its name means "empty quarter." A steep wall of mountains rises in the west.

Most of Saudi Arabia has little rainfall, very hot summers, and mild winters. There are no lakes or rivers that flow year-round. The country depends on underground water supplies.

Plants and Animals

Small shrubs and herbs are the main plants in Saudi Arabia. Some grasses and trees grow in the southwest, near the Red Sea. Date trees grow in oases, which are rare fertile spots in the desert.

Animals include foxes, wolves, hyenas, mongooses, porcupines, and baboons. Smaller numbers of gazelles, leopards,

and mountain goats also live in the country. A type of white antelope called an oryx is also found in Saudi Arabia, though it is very rare. The country's birds include falcons, eagles, ravens, and flamingos.

People

Saudis, or Arabs born in Saudi Arabia, make up most of the population. The rest of the people are mainly Arabs from other countries and South Asians. Some black Africans live along the Red Sea coast. Arabic is the main language.

Most Saudi Arabians live in cities and towns. The largest cities are Riyadh and Jiddah. Saudi Arabia's other major cities include Mecca and Medina, the two holiest cities in Islam. Every year millions of Muslims from around the world visit Mecca.

Camel racers compete in the King's Camel Race, an annual event in Riyadh, Saudi Arabia.

Almost all Saudi Arabians practice Islam. Following Islamic law, women and men are separated in public areas. Women also cover themselves with a black veil in public. Men traditionally wear head coverings and flowing white robes.

Economy

Saudi Arabia's economy depends on the production and sale of petroleum, or oil. The country also uses its oil to make fuels, chemicals, and other products. Other factories make cement, metal products, and processed food. Services—including tourism, banking, and communications—are also important to Saudi Arabia's economy.

Agriculture is limited in Saudi Arabia. Crops can be grown only in oases or by using artificial watering systems called irrigation. The crops include wheat, alfalfa, dates, tomatoes, and melons. Sheep, goats, and camels are the main livestock.

History

Humans have lived near the coasts of the Arabian Peninsula for thousands of years. In ancient times kingdoms on the peninsula controlled trade routes between Africa and Asia.

Birth of Islam

Muhammad, the founder of Islam, was born in Mecca in about AD 570. In 622 he moved from Mecca to Medina. This is said to mark the start of Islam. Before Muhammad died in 632, he brought most of the Arabian Peninsula under Islamic rule. In the following centuries Islam spread far beyond the peninsula.

Kingdom of Saudi Arabia

In 1517 the Ottoman Turks made the Arabian Peninsula part of the Ottoman Empire. The Ottomans held only loose control, however. Saudi ruling families held most of the real power.

In the 1700s the Sa'ud family joined with religious leaders to take control of the peninsula. By the end of the 1920s the leader Ibn Sa'ud had conquered all of what is now Saudi Arabia. In 1932 he

formed the Kingdom of Saudi Arabia. Sa'ud kings ruled Saudi Arabia into the 21st century.

Oil

Oil was discovered in Saudi Arabia in 1938. The country became a major supplier of oil to the United States and the rest of the Western world. The sale of oil allowed the Saudi government to build many new roads, schools, hospitals, and other buildings. Saudi Arabia became a leading power in the Middle East.

Modern Saudi Arabia

King Fahd took the Saudi throne in 1982. In 1990 Iraq invaded the neighboring country of Kuwait. King Fahd feared that Iraq might next invade Saudi Arabia. He invited the United States and other countries to put together a huge military force in his country. The military force defeated Iraq during the Persian Gulf War in 1991.

The Kingdom Centre towers above the surrounding buildings in Riyadh, the capital of Saudi Arabia. The building contains offices, apartments, shops, and a hotel. At the top is an observation deck.

In the late 1990s King Fahd passed much of his power to his half brother, Crown Prince Abdullah. After King Fahd died in 2005, Abdullah became king.

Sauk

The Sauk (or Sac) are a Native American group that probably once lived in what is now Michigan. By the 1600s, the Sauk had moved to what is now Wisconsin. They are closely related to a group of Native Americans called the Fox.

The Sauk traditionally grew corn, squash, and beans. They lived in villages in houses made from bark. After the harvest each year, the Sauk moved to their hunting grounds to fish and hunt animals, including bison (buffalo).

In the late 1700s the Sauk moved into what is now Illinois. In 1804 one Sauk group gave up its land to the United States. Many other Sauk became angry with this. Some Sauk people moved to what is now Iowa in 1830, but other

A Sauk warrior wears war paint on his face.

Sauk refused to leave their lands.

Among them was Black Hawk, a war chief. His people stayed in their village while U.S. settlers began to move onto their land.

The United States finally sent in troops to drive the Sauk from the village. The fighting that followed became known as the Black Hawk War of 1832. The Sauk were quickly defeated.

Settlers continued to move onto Sauk land. In the late 1800s the Sauk moved to what is now Oklahoma, where they shared a reservation with the Fox. They are sometimes considered one group called the Sauk and Fox tribe.

There were about 4,500 Sauk and Fox people in the United States at the end of the 20th century. They lived in Kansas, Nebraska, Oklahoma, and Iowa.

Sault Sainte Marie Canals

The Sault Sainte Marie canals form one of the world's major canal systems. Ships use the canals to travel between Lake Superior and Lake Huron.

The system is made up of two canals along the Saint Marys River. This river connects Lake Superior and Lake Huron. Part of the river is very dangerous. The canals were built so that ships could get around this area. The United

States operates one of the canals. Canada runs the other one.

The Canadian canal is 1.4 miles (2.3 kilometers) long. It has a special device called a lock. The lock raises or lowers ships to the water level of the lake they want to enter. The U.S. canal is 1.6 miles (2.6 kilometers) long. It has four locks. They are nicknamed the Soo Locks.

The canals are very important to the economies of two cities. These cities are both named Sault Sainte Marie. They are located on either side of the Saint Marys River. One city is in the Canadian province of Ontario. The other is on Michigan's Upper Peninsula.

In 1669 French missionaries gave the name Sault Sainte Marie to the area around the Saint Marys River. The name means "the rapids of Saint Mary." The first large locks on the Michigan side

opened in 1855. Large locks on the Canadian side opened in 1895.

Scald

► see Burn and Scald.

Scarlet Fever

Scarlet fever is a disease named for the scarlet (red) rash it causes. Once common among children, scarlet fever is now rare.

The first symptoms, or signs, of scarlet fever are a high fever and a sore throat. The person may vomit and ache. About two days later a red, rough rash appears. It usually starts on the neck and chest and then spreads. The face also looks red, often with a pale area around the mouth. The tongue may have a whitish coating at first. When the coating disappears, the tongue is swollen and bumpy.

The arm of a young person shows the red rash of scarlet fever.

Symptoms last for about a week. Afterward the skin may peel.

Tiny living things called bacteria cause scarlet fever. The kind of bacteria that causes the disease also causes strep throat. The bacteria produce poisons that cause the red rash. The bacteria easily spread between people through contact. Hand washing helps to prevent the bacteria from spreading.

People with signs of scarlet fever should go to a doctor. Doctors treat scarlet fever with a type of drug called an antibiotic. Rest also helps. Cold foods can ease throat pain.

Schulz, Charles

Charles Schulz was the creator of the long-running “Peanuts” comic strip. Charlie Brown, Snoopy, and the other “Peanuts” characters made Schulz famous all over the world.

Charles Schulz

Early Life

Charles Monroe Schulz was born in Minneapolis, Minnesota, on November 26, 1922. He loved to draw as a child. His first published cartoon was a drawing of his small black-and-white dog, Spike. This drawing appeared in a newspaper in 1937. Spike later was the model for Snoopy of “Peanuts.”

Schulz joined the Army after leaving high school. He served in Europe during World War II (1939–45).

“Peanuts”

In 1947 Schulz began drawing a comic strip called “Li'l Folks.” “Li'l Folks” ran in a newspaper and a magazine. In 1950 Schulz sold “Li'l Folks” to a company that sells comic strips to newspapers. The company renamed the strip “Peanuts,” even though Schulz did not like the name.

“Peanuts” appeared in seven U.S. newspapers in 1950. By 1958 “Peanuts” appeared in 355 U.S. newspapers and 40 newspapers in other countries. “Peanuts” eventually ran in about 2,600 newspapers in 75 countries. Some 355 million people around the world read the comic strip.

Schulz's characters later appeared in several animated television specials. The first of these was *A Charlie Brown Christmas* in 1965. In 1967 the stage musical *You're a Good Man, Charlie Brown* opened in New York City. It became a favorite with audiences.

Retirement and Death

Schulz announced his retirement from drawing “Peanuts” in December 1999. He died in his sleep on February 12, 2000, the night before the final “Peanuts” strip appeared in newspapers.

Science

Science is a huge field of study. It deals with the search for knowledge about the universe and all that is in it. People who work in science are called scientists.

Branches of Science

Science includes a wide range of subjects. These subjects can be grouped into three branches: the physical sciences, the life sciences, and the social sciences.

Physical Sciences

The physical sciences deal with nonliving things—from the tiny particles that make up an atom to the universe itself. Physics is the study of matter and the forces that act on it. Chemistry is the study of substances. Astronomy is the study of stars, planets, and other objects in outer space. The Earth sciences are the study of Earth’s features. Mathematics, the study of numbers, is a physical science, too. It is also a tool used in almost every other area of science.

Life Sciences

The life sciences deal with living things and their surroundings. Biology is the study of the natural world and every-

Medical researchers work in a laboratory in Ghana.

thing that lives in it. Botany, the study of plants, and zoology, the study of animals, are fields within biology. Medicine is the science of health.

Social Sciences

The social sciences deal with human life and culture. Sociology is the study of societies, or the groups that people form. Psychology is the study of the human mind and emotions. Geography is the study of Earth’s surface. Anthropology is the study of humans through history. Economics is the study of wealth.

The Scientific Method

Scientists believe there is a natural explanation for most things. For any problem they see, they try to understand the cause so they can come up with a solution. By learning what causes a disease, for example, scientists can work to control its spread.

The process that scientists use to solve problems is called the scientific method. Scientists start by finding out as much as possible about a problem. They usually

A student explains his science fair project to a judge. Students who participate in science fairs use the scientific method to solve a problem or answer a question.

read articles and books. They want to discover what other scientists have learned about it. Then they make a hypothesis, or an educated guess, to explain it. They test the hypothesis with an experiment. If the hypothesis fails to explain the problem, the scientists revise the hypothesis and test it again.

If the hypothesis is correct, other scientists repeat the experiment. They want to make sure that they get the same results. If they do, the hypothesis is accepted as a theory, or an explanation for why something happens. A theory may later need to be changed if scientists discover new information about the subject.

Science Fiction

Science fiction is a special type of fiction, or story. Humans have long wondered what life on another planet might be like. People have also wondered how different kinds of technology might affect life on Earth. Made-up stories that address such questions are called science fiction.

These stories may discuss ideas about scientific facts or real technology. But they also involve a lot of imagination. For example, a story might describe people meeting with space aliens for the first time. Another story might imagine what would happen if robots or computers could think and feel like humans. Many science fiction stories present different possible futures for human society.

Science fiction seeks largely to entertain. However, many science fiction stories also imagine different ways people might act and relate to one another. In this way

The science fiction movie *Star Trek III: The Search for Spock* shows what future spacecraft might look like.

science fiction may help reveal important things about human nature and society.

A few authors, such as Jules Verne and H.G. Wells, wrote science fiction in the 1800s or even earlier. But science fiction did not become a major type of writing until the 1900s. The first rockets sent into space and rapid advances in technology helped create an interest in this writing. Authors such as Isaac Asimov, Arthur C. Clarke, and Robert Heinlein helped establish the style as a form of serious literature.

Science fiction stories have also been the subject of television shows and movies in the 20th and 21st centuries. Popular examples include the *Star Trek* television shows and movies and the *Star Wars* series of movies.

Scorpion

Scorpions are small animals with a curved tail that can deliver a poisonous sting. Of the 1,400 species, or kinds, of scorpion, about 25 can kill people with their poison. Most scorpions will not sting unless bothered. Scorpions are members of the group of animals called arachnids. They are relatives of spiders.

Scorpions are found throughout the world except in Antarctica. Many live in the desert, but they also can be found in grasslands, in caves, and in forests. They range in length from 0.5 inch to 8.3

A scorpion carries its stinger arched above its head.

inches (1.3 to 21 centimeters). The longest scorpion is the rock scorpion of South Africa. Most desert species are yellowish or light brown. Other species tend to be dark brown or black.

Like spiders, scorpions have four pairs of legs. They also have claws, which help the scorpion grasp prey. A scorpion carries its tail arched over its back. The tip of the tail has a sharp, hollow stinger. Poison is squeezed through the stinger to paralyze larger prey. For humans, medicine may be able to stop the effects of the poison if given shortly after the sting.

Scorpions hide for much of the day and come out at night to eat. They feed on insects and spiders, but larger species may eat lizards, snakes, mice, and other scorpions. Scorpions spend most of their time alone.

Spider

Scotland

Scotland is a part of the United Kingdom, a country of western Europe. The other parts of the United Kingdom are England, Wales, and Northern Ireland. Scotland covers the northern third of the island of Great Britain. It borders England to the south. The capital of Scotland is Edinburgh.

Geography

Scotland has three land regions. The Highlands, in the north, have rocky mountains and many lakes. The Central Lowlands are hilly and have Scotland's best farmland. The Southern Uplands have narrow, flat valleys between low mountains. Many small islands also belong to Scotland. These include the Orkney Islands, the Shetland Islands, and the Hebrides. Scotland's climate is mild and cool.

Heather, grasses, and shrubs cover much of Scotland. Peat bogs are common, too. These are swampy areas with wet, peaty soil.

People

The people of Scotland mostly belong to two groups. The Scots are descendants of the ancient people called Celts. They live in the Highlands. The rest of the people mainly have Anglo-Saxon roots, like the people of northern England. Scotland also has people with Irish, Lithuanian, Italian, Polish, Jewish, and South Asian roots. Almost all of the people speak English. A few people speak old languages called Scottish Gaelic and Scots. The main religion is Christianity.

Economy

Scotland's economy depends mainly on service industries such as tourism, finance, government, and real estate. Manufacturing businesses make computers, metals and metal products, clothing, chemicals, and foods. The oil and natural gas industries are also strong. Farmers raise cattle, sheep, pigs, and chickens. They grow wheat, barley, and potatoes. Fishing and forestry are important industries, too.

Urquhart Castle overlooks Loch Ness in Scotland. "Loch" means "lake" in the Scottish Gaelic language.

History

By the 1st century AD several different peoples had settled in what is now Scotland. The Romans invaded in about AD 80. Though the Romans had conquered England and Wales, they could not defeat the peoples of Scotland.

By the 400s four peoples had established kingdoms in the region: the Picts, the Britons, the Angles, and the Scots. The Scots were a group of Celts from Ireland. Between the 800s and the 1000s the kings of the Scots unified the peoples into one kingdom.

In 1296 the king of England invaded Scotland and declared himself its king. The Scottish people fought English rule. William Wallace and Robert the Bruce were heroes of the war for independence. In 1328 Scotland became independent with Robert as its king.

Scotland continued to clash with England for more than 250 years. But in 1603 Scotland and England were united under one king. Then, in 1707, Scotland's Parliament, or lawmaking body, was merged with England's. The entire island of Great Britain was then one kingdom, which was called Great Britain. In 1801 Ireland joined the union, creating the United Kingdom. (Most of Ireland later broke away from the union.)

In the 1900s many people in Scotland wanted more of a say in their government. In 1997 the people voted to create a new Scottish Parliament. It took control of many of Scotland's affairs.

The national Parliament in England still governed the United Kingdom as a whole.

Scouting

A Cub Scout in the United States gathers newspapers for recycling.

The Boy Scouts and the Girl Scouts (also called Girl Guides) are groups that teach useful skills and good citizenship to boys and girls. Scouts often hike, camp out, and take part in other outdoor activities. Many countries around the world have scouting groups.

Boy Scouts

A British Army officer named Robert Baden-Powell started the Boy Scouts in 1907. In 1908 he published the first

Boy Scout handbook. This book introduced the Boy Scouts' motto, "Be Prepared."

Scouting soon spread around the world. The Boy Scouts of America started in 1910. It has several programs to serve different age groups. Tiger Cubs are 7 years old. Cub Scouts are 8 to 10, and Boy Scouts are 11 to 17. A Venturing program serves older youths.

The Boy Scouts have several ranks, or levels. A scout rises from one rank to the next by learning skills and performing services. A scout may also earn merit badges for learning new skills or studying new subjects.

The basic scouting group is called a troop. Scouts from many troops meet in gatherings called jamborees. A world jamboree takes place about every four years. As the 21st century began, more than 25 million children and teenagers from more than 200 countries were active in the Boy Scouts.

Girl Scouts

Very soon after the Boy Scouts began, many girls became interested in scouting. In 1910 Baden-Powell started the Girl Guides. Juliette Gordon Low started the Girl Scouts of the U.S.A. in 1912.

Girl Scouts serve their communities and countries in many ways. For example, they may gather food and clothing for the needy, help others learn to read, or work to protect the environment. Since

Indonesian Girl Scouts salute their country's flag.

the mid-1930s, Girl Scouts in the United States have sold cookies to raise money.

Like the Boy Scouts, the Girl Scouts are divided into age groups. A girl as young as 5 years old can be a Daisy Girl Scout. The Brownie Girl Scouts are 6 to 8, and Junior Girl Scouts are 8 to 11. Girl Scouts can be as old as 17 years. Girls, like boys, earn badges as a sign of their accomplishments.

The World Association of Girl Guides and Girl Scouts started in 1928. By the early 21st century, the association had more than 10 million members from 140 countries.

Sculpture

Sculpture is a branch of the visual arts. It involves the creation of artistic objects in three dimensions—length, width, and height. The main feature of a sculpture's

Did You Know?

The highest rank in the Boy Scouts of America is the Eagle Scout.

design is the way its forms extend through space. Size, texture, light and shade, and color are also important design elements. A sculpture may look exactly like a person or object or may reflect shapes and forms that the artist invents.

Sculpture may be either in the round or in relief. A sculpture in the round stands on its own. It can be viewed from all sides. A relief is attached to a background, so it is not designed to be viewed from the back. Reliefs often decorate buildings.

Materials

Clay has been one of the sculptor's chief materials since ancient times. Clay is easy to obtain and to use. Once early peoples learned to make bronze, metals became a popular choice for sculpture as well. Most metals are very strong and long-lasting. Sculptors value their color and shine. Wood has long been a popu-

A stone sculpture of an angel stands on a bridge in Rome, Italy.

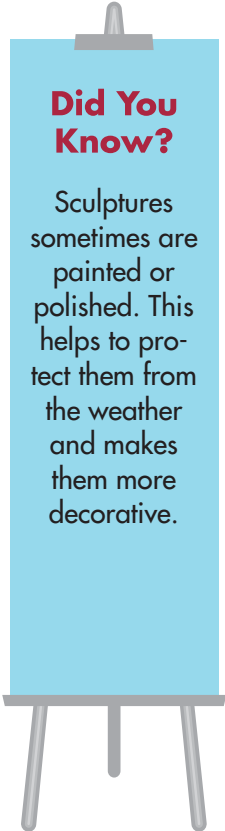

A woman sculpts a bust, or a figure of a person's head and shoulders, from clay.

lar material for carving. It is one of the main materials used by sculptors in Africa and Oceania. Sculptors have long used stone for outdoor statues and monuments because it resists damage by rain and wind. Popular types of stone for sculpture include marble, alabaster, granite, sandstone, limestone, and semi-precious stones.

Modern sculptors use these traditional materials as well as many others, including plastics, fabrics, fiberglass, neon tubes, and even garbage. Today, concrete is often used for large outdoor projects. This is because it is cheap, hard, and long-lasting.

Processes

The most common ways to form sculpture are carving, modeling, casting, and constructing. Carving is the process of turning such substances as stone, wood, or ivory into a desired shape by cutting or chipping away pieces. Modeling involves shaping a soft material such as clay by hand. It can then be baked until

Did You Know?

Sculptures sometimes are painted or polished. This helps to protect them from the weather and makes them more decorative.

it hardens. Models can also be used in casting.

Casting is used to reproduce a piece of sculpture through the use of a mold. In one version a plaster mold is made around a model. When the mold has hardened, it is split apart and taken off the model. The mold is then put back together, with a hollow space where the model was. A mixture of plaster and water is poured into the mold and left to dry. When the mold is chipped away, a perfect copy of the original model remains. A method of casting with wax is commonly used for metal sculptures. This process can be used to create many copies of a statue.

Modern sculptors sometimes construct sculpture out of assorted materials. They may use such techniques as welding, screwing, nailing, or gluing to combine different pieces of material.

History

Early Sculpture

Sculpture from prehistoric times has been found around the world. The earliest sculptures are made of such naturally occurring materials as clay, stone, and ivory. Beginning in about 3000 BC, people also began to make sculptures of bronze and other metals.

In early civilizations sculpture was associated largely with religion. In the Middle Eastern region of Mesopotamia almost all early sculpture was used in temples. People in ancient Egypt created huge sculptures of their kings and gods,

emphasizing their power. They also made many statues and reliefs for use in tombs.

In ancient Greece sculpture reached its high point in the 400s BC. The Greeks of this period aimed to show humans and gods in their most perfect forms. Most of their statues appear calm in expression and pose. The ancient Romans later made many copies of Greek sculpture. In this way they preserved the Greek tradition for later generations.

From about AD 200 the new religion of Christianity began inspiring artists to create works that reflected Christian figures and events. During the Middle Ages (from about 500 to 1500), much European sculpture was closely related to church architecture.

Sculpture in India has also centered on religion. The Gupta period, lasting from about the 300s to the 500s, produced some of the best examples of Buddhist sculpture.

Renaissance, Baroque, and Neoclassicism

The period in Europe called the Renaissance (mid-1300s through the 1500s) was a time of outstanding artistic achievement. Renaissance artists were inspired by the classical styles of ancient Greece and Rome. The Renaissance began in Italy. The Italian artists Donatello and Michelangelo were among the finest sculptors of the period.

In the 1600s baroque became a major style of Western art. Baroque sculpture is dramatic and highly decorative. It appeals to the senses and emotions. The leading baroque sculptor was the Italian artist Gian Lorenzo Bernini.

The neoclassical (meaning “new classical”) style was popular in Europe in the 1700s. As in the Renaissance, sculptors in this period sought to revive ancient Greek and Roman ideals of beauty. A leading sculptor of this style in Italy was Antonio Canova.

Modern Sculpture

In the late 1800s the French sculptor Auguste Rodin challenged centuries of tradition. He showed the human figure expressing tension and fleeting emotions. He also sometimes used textured surfaces that heighten the sense of life and movement. In these ways Rodin’s sculpture differs from the cold, impersonal smoothness of the classical tradition. With their strong sense of power and drama, his works greatly influenced sculptors of his own time as well as of the modern era.

In the 1900s and beyond, sculptors experimented with form and materials. Sculptors such as Constantin Brancusi, Henry Moore, Barbara Hepworth, and Raymond Duchamp-Villon created works of abstract sculpture—sculpture that does not try to realistically represent anything in the visible world. Instead, these sculptors focused on the shapes and forms themselves. Some sculptors used objects found in the everyday world to make viewers see the

An abstract sculpture by Barbara Hepworth is on display at a sculpture garden at the University of California, Los Angeles.

objects in a different light. Their aim was not to please the eyes but to make the viewer think about what art is and can be.

Sea Anemone

Sea anemones look like flowers but are actually animals. Their “petals” are arm-like body parts called tentacles, which circle the mouth. The tentacles may be

The jewel anemone is a kind of sea anemone.

red, yellow, green, blue, orange, brown, white, or a mixture of colors. Sea anemones use their tentacles to sting the shrimps, fish, and other small animals that they eat.

There are more than 1,000 species, or kinds, of sea anemone. They live in oceans throughout the world.

Sea anemones are invertebrates, which means they do not have a backbone. They have soft bodies that may be thick and short or long and slender. Most of the body is made up of water. Sea anemones range from less than an inch (2.5 centimeters) to about 5 feet (1.5 meters) across.

Most sea anemones rarely move. Some glide very slowly or do slow somersaults. Sea anemones are usually found attached to a hard surface such as a rock, a sea-shell, or the back of a crab. A flattened disk attaches the animal to an object by suction. Some sea anemones float near the ocean's surface or burrow deep into sand or mud.

Sea anemones are related to jellyfish. Like a jellyfish, a sea anemone can sting a person who touches it. The sting can cause pain or sickness.

Sea Horse

A sea horse is an unusual fish with a horselike head. There are more than 20

A sea horse uses its tail to anchor itself to undersea plant life.

species, or types, of sea horse. They live in warm and mild seas.

Sea horses are small fish. They are about 1 to 12 inches (4 to 30 centimeters) long. Instead of scales, a sea horse has bony rings covering its body. Sea horses can be bright yellow or orange, or they can be brown or black. Some are striped or speckled. They often blend in with nearby plants.

A sea horse usually spends its life in one small area near the shore. It wraps its curled tail around seaweed or coral to keep from being swept out to sea. Sea horses swim in an upright position. They are weak swimmers.

Sea horses feed constantly. They eat tiny creatures such as brine shrimp. A sea horse sucks food into its tiny mouth through its snout.

Did You Know?

In some countries people eat sea anemones. Cooking the sea anemone gets rid of the poison.

Sea horses are unusual in the way they reproduce. The female lays her eggs in a pouch beneath the male's tail. The male carries the eggs until they hatch. The baby sea horses look like small adults.

Many people like sea horses because of their interesting appearance. Some people keep sea horses in aquariums. In some places people use sea horses in medicine.

Seal

Seals are mammals that live mostly in cold seas. They are related to the walrus. There are more than 30 species, or kinds, of seal. They can be divided into two groups: earless, or true, seals and eared seals. Earless seals actually do have ears, but they do not stick out. Eared seals have visible ears. Sea lions are eared seals with a thick, hairy neck that looks like a lion's mane.

Seals are found throughout the world. They are especially plentiful in seas near

the North and South poles. Some species like the open ocean. Others prefer to live along the coast. All seals spend some time on islands, beaches, or sheets of ice. They come ashore to breed.

A seal's body is round in the middle and narrower at the ends. The skin is usually brown, gray, or black. The smallest seals are about 4 feet (1.2 meters) long and weigh about 200 pounds (90 kilograms). The largest seals can be 21 feet (6.5 meters) long and weigh more than 8,000 pounds (3,600 kilograms). They are called elephant seals.

Instead of legs, seals have two pairs of flippers. Flippers help seals to swim. Eared seals can turn their rear flippers forward under the body. This allows them to scoot around while on land.

The ears of true seals do not stick out.

The ears of true seals do not stick out.

Earless seals cannot turn their rear flippers forward. They move on land by wriggling on their bellies. They also may pull themselves forward with their front flippers.

Seals eat mostly fish. Some also eat squid and shellfish. The leopard seal of the Antarctic feeds on penguins and other seals.

Sea Snake

Sea snakes are snakes that spend most of their lives in water. They usually swim in groups. From far away, a group can look

The banded sea krait is a sea snake of the Pacific Ocean.

like one long snake. For this reason, sea snakes may have inspired legends about giant sea serpents.

Sea snakes belong to the same family as cobras. There are about 50 species, or types, of sea snake. Most are found in Asia, Australia, and the Pacific Islands. Sea snakes live in warm, coastal waters. They can also be found in rivers, lakes, and swamps. Only the yellow-bellied sea snake swims hundreds of miles out into the ocean. This sea snake is also the only known reptile that spends its entire life in water.

Most sea snakes are 3 to 5 feet (0.9 to 1.5 meters) long. Many have light-colored bodies with dark rings. Sea snakes have short, hollow fangs that contain venom, or poison. This venom attacks the nervous system (nerves and brain) and can be deadly. Sea snakes eat eels, fish, and fish eggs.

Sea snakes are specially made for the water. They have a flat tail that is shaped like an oar. The snakes swim by moving the tail from side to side. Their lungs can also hold extra oxygen. This allows them to stay underwater for long periods. Some sea snakes have very small belly scales. These scales make them unable to crawl on land.

Season

As a year passes, regular changes occur in the weather. This cycle of weather

changes is divided into four parts, known as the seasons. The four seasons are winter, spring, summer, and autumn, or fall.

What Causes the Seasons

The seasons are related to the way sunlight falls on different parts of Earth in the course of a year. As Earth revolves around the sun, the North Pole points to the same direction in space. For about six months of every year the North Pole is tilted toward the sun. During this time the Northern Hemisphere gets more direct sunlight than the Southern Hemisphere. The Northern Hemisphere also gets more hours of daylight. During the other six months the North Pole is tilted away from the sun. The Southern Hemisphere then gets more direct sunlight and more hours of daylight.

When the Northern Hemisphere is getting the most sunlight, it experiences its warmest season—summer. At the same time, the Southern Hemisphere is getting the least sunlight, so it experiences its coldest season—winter. The seasons in the Northern and Southern hemispheres are always opposite.

When the Seasons Begin

Summer begins on the summer solstice, which is the day with the most hours of daylight. This is June 21 or 22 in the Northern Hemisphere. It is December 21 or 22 in the Southern Hemisphere. Winter begins on the winter solstice, which is the day with the fewest hours of daylight. In the Northern Hemi-

How Seasons Change

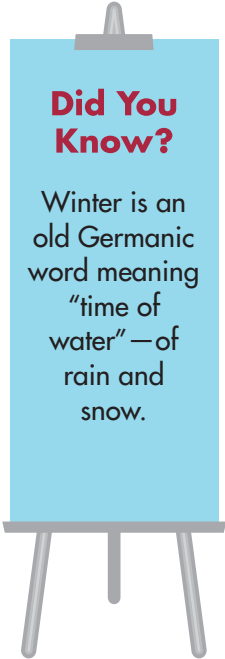

A diagram shows the position of Earth at the beginning of each season in the Northern Hemisphere.

sphere this is December 21 or 22. In the Southern Hemisphere the winter solstice is June 21 or 22.

Autumn begins on the autumnal equinox. This is September 22 or 23 in the Northern Hemisphere. It is March 20 or 21 in the Southern Hemisphere. Spring begins on the vernal equinox. In the Northern Hemisphere this is March 20 or 21. In the Southern Hemisphere it is September 22 or 23. On both equinoxes the hours of daylight are equal to the hours of darkness everywhere on Earth.

Effects of the Seasons

The changes in weather during each season depend on how close a region is to the equator. Places at the equator get the most sunlight throughout the year. For this reason there is little difference from one season to the next. There may be rainy or dry periods, but temperatures are generally warm year-round.

Did You Know?

Winter is an old Germanic word meaning “time of water”—of rain and snow.

The North and South poles are the farthest points from the equator. Therefore temperatures stay cold throughout the year. During the winter it is dark even in the daytime. In the summer the sun shines late at night. However, this “midnight sun” is not strong enough to give the poles hot weather.

Between the poles and the equator, temperatures may vary greatly from one season to the next. During winter, the weather is generally cold and often snowy. Some animals hibernate, or sleep for a long time. Many birds have migrated, or moved to warmer places for the season. Some plants die, and others stop growing.

When spring arrives temperatures become warmer. Plants and trees produce new leaves and flowers. Birds return from their winter homes, and animals come out of hibernation.

During the summer, temperatures reach their highest levels. There are more hours of daylight, and the sun is more intense. This extra sunshine helps plants to grow.

Temperatures fall again as autumn begins. Some trees and plants lose their leaves. Animals with fur grow thicker coats to keep them warm during the coming winter. Many birds travel to warmer places.

Seed

Most plants begin life as seeds. Plants form their seeds inside flowers or cones. In flowering plants a fruit often surrounds the seeds.

Seeds need the right conditions to germinate, or grow into a new plant. They need air, water, the right temperature, good soil conditions, and the right amount of light.

Features

A seed contains a miniature plant, called an embryo, that can develop into a fully grown plant. The outer shell of a seed, called a seed coat, protects the embryo. Inside the seed a nutritious material provides food to the embryo. In flowering plants this material is called endosperm.

Germination

Once a seed has formed, it leaves its parent plant. Seeds often can stay dormant, or inactive, for many years before they germinate, or grow. Because of this, people can store seeds and plant them later. A seed will germinate once it is in the ground and the conditions are right.

As germination begins, parts of the embryo break out of the seed coat. One part grows downward. It becomes the plant's roots, which take in water and food from the soil. Other parts grow upward. They become the plant's stem and leaves, which absorb sunlight.

How Seeds Travel

It is important that seeds travel away from their parent plant. If the seeds land nearby, they compete with the parent for light and water. This means that they are less likely to survive.

Seeds travel in many ways. Some plants have fruits or pods that burst open to scatter the seeds inside. The wind blows lightweight seeds. Some seeds, such as those of dandelions, have fluffy parts that help them to drift through the air. Some plants, such as coconut palms, drop their seeds in nearby water. These seeds have waterproof coverings that let them float far away.

Animals also carry seeds to other places. Seeds with sticky or prickly seed coats stick in the fur of animals. The seeds drop to the ground later. When birds and other animals eat fruit, the seeds

pass through their bodies and often end up far from where they ate the fruit.

Uses

Seeds are an important source of food for people and animals. Seeds used for food are often called grains or beans. People also use seeds to make oils, spices, fabric dye, and jewelry.

Seminole

The Seminole are Native Americans who were once part of the Creek tribe of the U.S. state of Georgia. In the 1700s they broke away from the Creek and moved southward into northern Florida. The name Seminole probably came from the Spanish word *cimarrón*, which means “wild” or “runaway.”

A photograph taken in the 1920s shows a group of Seminole wearing traditional clothing. They are standing in front of their houses.

The Seminole lived in villages. A chief ruled each village. The Seminole made their homes by covering wooden frames with roofs of branches, grass, and bark. They grew corn, squash, beans, and pumpkins. They also hunted, fished, and gathered wild plants.

After the Seminole reached Florida, they were joined by runaway slaves from Georgia. In 1817–18 U.S. troops tried to recapture the slaves by attacking Seminole towns. This conflict became known as the First Seminole War.

In 1832 the U.S. government tried to get the Seminole to move to Indian Territory (now Oklahoma). Most refused. From 1835 to 1842 they fought U.S. troops in the Second Seminole War. After the war most Seminole moved to Indian Territory.

A few hundred Seminole were able to stay in Florida by hiding in the swamp-lands. In the 1850s U.S. troops tried to force them out. That conflict was called the Third Seminole War.

At the end of the 20th century there were about 12,000 Seminole. Most lived in Oklahoma or Florida.

Sendak, Maurice

Maurice Sendak is a U.S. artist and children's author. Many of his picture stories blend true-life situations with imaginary scenes. He is best known for his 1963 book titled *Where the Wild Things Are*.

Maurice Bernard Sendak was born on June 10, 1928, in New York City. As a child Maurice drew pictures and wrote

Maurice Sendak stands among enlargements of the pictures he drew for *Where the Wild Things Are*.

stories. After high school he trained at an art school in New York City.

The first children's books Sendak illustrated were Marcel Aymé's *The Wonderful Farm* (1951) and Ruth Krauss's *A Hole Is to Dig* (1952). Sendak went on to illustrate more than 80 children's books by a number of different authors.

In the mid-1950s Sendak began writing and illustrating his own books. In 1963 Sendak published *Where the Wild Things Are*, which made him famous. In 1964 Sendak earned the Caldecott Medal for his illustrations for the book.

In the 1970s Sendak turned his talents to television and theater. He created opera versions of some of his stories, and he designed sets for the stage. Sendak also continued producing children's books into the 1990s.

Seneca

The Seneca were the largest of the five Native American tribes that formed the Iroquois Confederacy. The tribes of the confederacy lived in what is now the U.S. state of New York. They all spoke similar languages. The Seneca traditionally lived in western New York.

Like the other Iroquois, the Seneca lived in longhouses. Longhouses were large, rectangular homes made of a wooden frame covered with bark. For food, the

Cornplanter was a chief of the Seneca in the 1700s.

Seneca grew corn, beans, and squash. They also fished and hunted.

In the 1600s European traders began arriving in Seneca territory. The Seneca traded furs with them for guns and metal tools. During the American Revolution (1775–83) the Seneca sided with the British. After the Americans won the war, the Seneca lost much of their land. A small group of Seneca fled to Canada, but most stayed in New York. In 1817 some Seneca settled in Ohio. In 1831 they gave up this land in return for land in Indian Territory (now Oklahoma).

At the end of the 20th century there were about 9,000 Seneca in the United States. Most lived in New York and Oklahoma. Another 1,000 lived in Canada, mainly in Ontario.

Senegal

The country of Senegal sits on the west coast of Africa. Senegal has produced several famous writers, including Léopold Senghor, the country's first president. Dakar is the capital and largest city.

Geography

The Atlantic Ocean forms Senegal's western border. Senegal shares land borders with Mauritania, Mali, Guinea, Guinea-Bissau, and The Gambia. The Gambia extends into Senegal from the coast. The small part of Senegal south of The Gambia is called the Casamance region.

Most of the land is flat and low. In the west are small plateaus, or areas of flat, raised land. Low mountains rise in the east. Senegal has four major rivers: the Senegal, the Saloum, the Casamance, and the Gambia. Most of the country is

Baobab trees grow in a grassy area of Senegal.

hot year-round. The south gets more rain than the north.

Plants and Animals

Grasses and scattered trees grow in much of Senegal. Forests are thicker in the south. Mangrove trees grow along the southern coast.

Senegal's animals include monkeys, panthers, warthogs, and wild dogs. Some chimpanzees, elephants, hippopotamuses, antelope, lions, and leopards live in a national park in the southeast.

People

Senegal has several large ethnic groups, including the Wolof, the Fulani, the Serer, the Tukolor, the Diola, the Malinke, and the Soninke. The Wolof are the largest group. French is the national language, but most people speak the language of their group. Most of the people follow the religion of

Islam. More than half of the population lives in the countryside.

Economy

Most of Senegal's people work in agriculture. Peanuts are a major crop. Other important crops include rice, sugarcane, millet, watermelons, cotton, and vegetables. Senegal sells a lot of fish to other countries.

Senegal's industries produce peanut oil, ships, fertilizers, and petroleum products. Senegal also mines salt and phosphates, which are used to make fertilizers. Tourism, communications, and other services have become important parts of the economy.

History

Humans have lived on the land that is now Senegal since prehistoric times. The Tukolor people settled in the area almost a thousand years ago. At about the same time Berbers from the north began

spreading Islam throughout the region. The Wolof, the Serer, and other peoples later developed kingdoms.

European Trade

European explorers reached the area in the 1400s. The first to arrive were the Portuguese. The Dutch, the English, and the French came later. The Europeans set up trading posts along the coast beginning in the 1600s. They traded African slaves, ivory, gold, and a useful plant material called gum.

French Rule

In 1895 Senegal became a part of the large French colony of French West Africa. In 1958 Senegal became a separate state within the French Community, a group of countries with ties to France. Senegal soon left the community, however, and formed a union with Mali. In 1960 Senegal separated from Mali to become an independent country.

Independent Senegal

Léopold Senghor became Senegal's first president. He was a poet who had led the movement for independence. In 1982 Senegal and The Gambia formed a union called Senegambia. The union broke apart in 1989. Meanwhile rebels in the Casamance region began fighting Senegal for independence. The rebels and Senegal's government signed a peace agreement in 2004.

Senses

The senses help humans and other animals react to changes in their surroundings and inside their bodies. Animals receive sensory information all the time. They see a bug dart across a pond. They hear the roar of a lion. They smell a rose. They taste fresh bread. They touch a jagged piece of ice. They get dizzy from spinning in a circle.

After the body takes in sensory information, sense cells send the information to the brain. Sense cells are also called receptors. The information travels from receptors to the brain through nerves. The brain thinks about the information and then makes the body react to it.

The five basic senses are sight, hearing, smell, taste, and touch. The eyes sense sight. The ears sense sounds. The skin senses touch. On the tongue, taste receptors are found in structures called taste buds. They identify sweet, salty,

Humans use their skin, eyes, nose, tongue, and ears to sense information in the world around them.

Different animals have special body parts to sense sound, movement, heat, touch, and other information.

sour, bitter, and meaty tastes. The nose detects smells. The receptors in the nose also help with the sense of taste.

In addition to the five basic senses, nearly all animals sense motion, heat, cold, pressure, pain, and balance. The sense of motion—knowing where the arms and legs are and where to move them—is called kinesthesia. The sense of balance, or equilibrium, is controlled by structures in the inner ear. These structures help keep the body in balance and prevent falls.

Seoul

Population
(2008 estimate)
10,421,780

Seoul is the capital of South Korea, a country in eastern Asia. Before 1948 South Korea and North Korea were one country. For hundreds of years during that period Seoul was the capital of all of Korea. The city's name itself has come to mean "capital" in the Korean language.

Seoul is one of the largest cities in the world. It is also South Korea's center of culture, education, business, and industry. It lies on the Han River.

The economy of Seoul is very important to South Korea. Many of the country's

Kyongbok Palace was built in Seoul in 1394. Most of the original buildings on the grounds were destroyed in invasions and wars. Some buildings have been rebuilt.

banks and insurance companies have their headquarters in the city. Factories in Seoul make clothing, machinery, electronics, processed foods, and other products. Printing is another leading industry.

People have lived in the Seoul area for thousands of years. A royal summer palace was built at the site in 1068. After that a large settlement was established there.

In 1394 the Choson rulers of Korea made Seoul the capital. The Choson ruled Korea until 1910. Japan controlled Korea from 1910 to 1945. Seoul remained the capital under Japanese rule. During that time Seoul was called Kyongsong.

Seoul was damaged during the Korean War (1950–53). Afterwards it was rebuilt and expanded greatly. The modern city

has many skyscrapers and an extensive transportation system. The city hosted the Summer Olympic Games in 1988.

Giant Sequoia • Redwood

Sequoyah

Sequoyah was an important member of the Cherokee group of Native Americans. He invented a system of writing so his people could read and write in their own language.

Sequoyah was born in about 1760 or 1770 in what is now Tennessee. He was probably the son of a British trader and a Cherokee woman. Sequoyah was raised by his mother and became a talented artist. From 1813 to 1814 he fought for the U.S. Army in the Creek War. This was a war between the U.S. government and the Creek Native Americans.

In about 1809 Sequoyah began working on a system of writing. The Cherokee people had their own spoken language,

Sequoyah invented a system for reading and writing the Cherokee language.

but they did not have a way to write in it. Sequoyah hoped that a written language would help the Cherokee to stay independent from white settlers.

Sequoyah used symbols to stand for each syllable used in the Cherokee language. (A syllable is a unit of sound.) His daughter helped him to pick out all the syllables in the Cherokee language. By 1821 he had created a system of 86 symbols that stood for all the Cherokee syllables.

Sequoyah's system, called a syllabary, soon became popular with other Cherokee. It was easy to use. The Cherokee began to teach it in their schools. They also published books and newspapers in their own language.

Sequoyah's people honored him for his accomplishments. He died in 1843.

Did You Know?

Sequoyah used letters from the English, Greek, and Hebrew alphabets to create his Cherokee symbols.

Serbia

Serbia is a country in southeastern Europe. It was a republic, or state, of the country of Yugoslavia for much of the 1900s. In the 1990s all of Yugoslavia's republics except Serbia and Montenegro became independent countries. In 2006 Serbia and Montenegro each became independent countries as well. The capital of Serbia is Belgrade.

Geography

Serbia is in the Balkan region of Europe. It shares borders with Kosovo and the countries of Montenegro, Bosnia and Herzegovina, Croatia, Hungary, Romania, Bulgaria, and Macedonia.

The Danube River flows through the northern part of the country, which is flat. The area south of the Danube is mainly mountainous. Most of the country has cold winters and warm summers.

Plants and Animals

Forests of oak and beech trees grow in the lower areas. Pine and fir trees grow in the mountains. The country's animals include deer, foxes, wolves, wild pigs, bears, and many types of birds.

People

Serbs make up most of the population. Small groups of Hungarians, Croats, Bosniacs (Bosnian Muslims), Roma (Gypsies), Montenegrins, and others also live in the country.

Most Serbs are Eastern Orthodox Christians. They speak Serbo-Croatian. About half of the people live in cities or towns.

Economy

Manufacturing is an important part of the economy. Factories make machinery, metals, chemicals, food products, electronics, cloth, cars, trucks, and other goods. The mining industry produces aluminum, copper, and lead.

Agriculture is also important. The major crops are corn, sugar beets, wheat, and potatoes. Farmers also grow grapes to make wine. Pigs, sheep, and cattle are the main livestock.

History

People have lived in the Balkan region for thousands of years. Slavic peoples, including the Serbs, settled in the area by the 600s. The Ottoman Empire con-

Farmers grow corn on a hillside in Serbia.

quered the Serbs in 1389. Serbia gained independence in the 1800s.

In 1914 a Serb assassinated Francis Ferdinand, the archduke (prince) of Austria. In response, Austria declared war on Serbia. This conflict turned into World War I.

Yugoslavia

After the war, in 1918, Serbia joined with Montenegro, Croatia, Slovenia, Macedonia, and Bosnia and Herzegovina to form a new country called the Kingdom of Serbs, Croats, and Slovenes. In 1929 the country was renamed Yugoslavia.

Communists took control of Yugoslavia after World War II ended in 1945. Yugoslavia had a strict Communist government until the late 1980s.

Civil War and Beyond

In 1991 and 1992 four of Yugoslavia's republics declared independence. Serbia wanted to keep Yugoslavia together. The republics fought a civil war until 1995. At the end of the war the republics of

Croatia, Slovenia, Macedonia, and Bosnia and Herzegovina were independent countries. Only Serbia and Montenegro remained in Yugoslavia.

After the war Albanians in the Serbian province of Kosovo also began fighting for independence. In response, Serbs attacked many Albanian villages. The fighting ended in 1999, but problems continued between Yugoslavia's Albanians and Serbs. The United Nations temporarily took over the government of Kosovo.

In 2003 the republics of Serbia and Montenegro formed a new union that gave each republic more independence. Montenegro broke away from the union in 2006. In 2008 Kosovo declared independence from Serbia. Other countries supported the move, but Serbia refused to recognize Kosovo as a separate country.

Serra, Junípero

Junípero Serra was a Spanish priest. In 1769 he founded the first mission (Christian community) in California at the Spanish settlement of San Diego. The Spanish established missions in North America to spread Christianity to Native Americans.

Serra was born on the Spanish island of Majorca on November 24, 1713. He became a priest in the Roman Catholic church. In 1750 he arrived in Mexico City to work as a missionary. He worked there until 1767, when he was sent to California to start missions there.

From 1770 to 1782 Serra founded eight more Californian missions. He died in Carmel, California, on August 28, 1784.

Seuss, Dr.

The author Theodor Seuss Geisel is better known to readers as Dr. Seuss. He wrote nearly 50 books for children. His stories are famous for their nonsense words, wild rhymes, and amusing drawings of unusual creatures.

Geisel was born on March 2, 1904, in Springfield, Massachusetts. He graduated from Dartmouth College in New Hampshire in 1925. Then he studied at Oxford University in England and the Sorbonne, a college in France. After that he worked as an illustrator and cartoonist.

Dr. Seuss poses with a Cat in the Hat toy.

During and after World War II (1939–45) Geisel served in a part of the U.S. Army that made informational films. Two films he made during the war won Academy awards.

Geisel's first children's book, *And to Think That I Saw It on Mulberry Street*, was published in 1937. He wrote it under the name Dr. Seuss. His most famous books include *Horton Hears a Who* (1954), *How the Grinch Stole Christmas* (1957), *The Cat in the Hat* (1957), *Green Eggs and Ham* (1960), *The Lorax* (1971), and *Oh, the Places You'll Go!* (1990). Geisel both wrote the stories and drew the pictures for his books.

In the late 1950s Geisel started a company called Beginner Books, which produced books for children. Geisel died on September 24, 1991, in La Jolla, California.

Seychelles

The country of Seychelles is a scattered group of islands in the western Indian Ocean. The capital, Victoria, is on the largest island, Mahé.

Geography

Seychelles lies about 1,000 miles (1,600 kilometers) east of Africa. It includes more than 100 islands divided into two groups: the Mahé group and the coral-line group. The Mahé islands are rocky and mountainous. The coralline islands are flat and made of coral.

Plants and Animals

Seychelles is home to the rare coco de mer, or double coconut tree. Avocados, breadfruit, bananas, mangoes, papayas, and pineapples also grow on the islands. Animals include green sea turtles, giant tortoises, and many types of bird.

People

Most of the people are Seychellois Creole. They have a mixture of Asian, Afri-

Seychelles is known for its fine beaches.

can, and European ancestors. The most common language is Creole. Creole is a mixture of French, English, and African languages. Roman Catholicism is the main religion. Most Seychellois live in cities or towns, mainly on Mahé Island.

Economy

Tourism is a major source of money for Seychelles. Fishing is another important part of the economy. The country's main product is canned tuna. Farmers grow coconuts, cinnamon, bananas, and tea. They also raise pigs and chickens.

History

No one lived on the islands until the 1700s, when French settlers arrived with their African slaves. In 1814, after losing a war, France gave the islands to Great Britain. Seychelles gained independence from Britain in 1976.

Shakespeare, William

William Shakespeare is often praised as the world's greatest playwright. Though he lived 400 years ago, his plays are still studied and enjoyed today.

Early Life

William Shakespeare was born in 1564 in the town of Stratford-upon-Avon, England. He had three younger brothers and two younger sisters. His father was a glove maker who later became the mayor of Stratford.

When Shakespeare was 18, he married Anne Hathaway. What Shakespeare did to support his young family is unknown. Some scholars think that he was a schoolteacher. Others think that he traveled with a group of actors.

Career in the Theater

By 1592 Shakespeare was working as a writer and actor in London. In that year a disease called the black plague devastated the city. Officials closed the theaters and other public places to stop its spread. Shakespeare then turned to writing poetry.

London's theaters reopened in 1594. By then Shakespeare had joined an acting group called Lord Chamberlain's Men. They often presented plays for royalty. Along with acting and writing, Shakespeare also was involved with the business side of theater. He became wealthy.

A collection of William Shakespeare's poems, printed in 1640, included a picture of the author.

Plays

Shakespeare wrote 37 plays in 20 years. His plays generally fall into three categories: tragedies, comedies, and histories. Tragedies are plays that describe the downfall of the main character. Shakespeare's most famous tragedies include *Hamlet*, *King Lear*, and *Macbeth*. Comedies are humorous plays that end happily. Shakespeare's comedies include *A Midsummer Night's Dream*, *As You Like It*, and *The Taming of the Shrew*. Shakespeare's histories are dramas about some of England's powerful kings, including Henry IV and Richard II.

Later Years

Shakespeare retired from the theater in about 1610. He returned to his hometown of Stratford-upon-Avon. He died there on April 23, 1616.

Shamrock

Several different plants that have three-part leaves are sometimes called shamrocks. The redwood sorrel is one such plant. It grows in the redwood forests of western North America.

A shamrock is a plant whose small, green leaves are divided into three heart-shaped parts called leaflets. Shamrocks are a symbol of Ireland, especially on Saint Patrick's Day.

Several different plants are known as shamrocks. They include some members of the pea family: white clover, small hop or suckling clover, and black medic. Wood sorrel is another plant called a shamrock. The plants all grow in the temperate, or mild, regions of the Northern Hemisphere. Experts disagree on which plant, if any, is the true Irish shamrock.

In rare cases a shamrock leaf has four leaflets instead of three. Finding a shamrock with four leaflets supposedly brings good luck.

Pea • Saint Patrick's Day

Shark

Sharks are fast-swimming fish that have a skeleton made of cartilage instead of bone. (Cartilage is an elastic tissue that is created before bone begins to form.) They are related to rays. Sharks are among the oldest animals on Earth. The first sharks lived more than 300 million years ago. Today there are more than 300 species, or types, of shark.

Where Sharks Live

Most sharks live in oceans in the mild or warm parts of Earth. But the Greenland shark lives in the cold Arctic waters. Sand sharks spend most of their time at the bottom of shallow water. The Portuguese shark lives in the deepest parts of the ocean.

Physical Features

The whale shark is the largest living fish. It can reach about 50 feet (15 meters) long and weigh nearly 20 tons. The smallest shark is the dwarf lantern shark, which is only about 7.5 inches (19 centimeters) long.

Sharks move restlessly to keep from sinking to the ocean floor.

Most sharks have a pointed snout that extends forward over the mouth. However, hammerhead sharks have a wide, flat head. A shark's teeth are sharp and triangular and grow throughout its life. Only a few species, including the white shark, the tiger shark, and mako sharks, have very large teeth. Sharks have a muscular, upturned tail and pointed fins.

Sharks normally have tough, gray skin with toothlike scales. Their skin also may be cream, yellow, brown, bronze, blue, or nearly black in color. They often are patterned with spots, bands, or marbling.

Behavior

Sharks use their sharp sense of smell to find food. They may eat plankton, shellfish, sea turtles, fish, seals, porpoises, squid, or whales. Sharks circle their prey and frequently approach from below. When excited by the smell of blood, sharks may have a "feeding frenzy." This means that they attack any object within reach and feed rapidly.

Sharks swim constantly to keep from sinking. They are known for their speed in the water. Most species can swim 20 to 30 miles (32 to 48 kilometers) per hour. But the speed of mako sharks has been recorded at more than 60 miles (97 kilometers) per hour.

Most sharks live by themselves. But a few, such as the spiny dogfish shark, form schools, or groups.

A hammerhead shark gets its name from its wide, flat head.

Reproduction

Sharks reproduce in one of three ways. In some types the female gives birth to live young. In other types the young hatch from eggs inside the female's body and then are born. In still other types the female lays rectangular, leathery eggs that become attached to rocks or seaweed. The young hatch days or weeks later. Female sharks may have from 2 to about 20 young at a time.

Sharks and Humans

People eat the meat of some sharks, including thresher and mako sharks. Only some species—including the white shark and the tiger shark—are considered dangerous to humans. When these sharks are hungry, disturbed, or defending their territory, they may attack humans. Even the movement and noises of swimmers can cause some sharks to attack. However, shark attacks are rare.

Shawnee

A Shawnee man wears a traditional headdress and feathers.

The Shawnee are Native Americans who traditionally lived over a large area in what is now the eastern United States. Their first known homeland was centered in what is now Ohio.

During the summer the Shawnee lived in wigwams. Wigwams were dome-shaped homes made from a frame of wood poles covered with bark. The women grew corn and other food crops. The men hunted. During the winter the Shawnee moved to hunting camps.

In the 1600s the Iroquois people drove the Shawnee from their lands. The Shawnee scattered. After 1725 many Shawnee returned to Ohio.

The Shawnee fought repeatedly to defend their lands against white settlers who wanted to expand westward. In 1794 U.S. troops defeated the Shawnee in the battle of Fallen Timbers. In 1795 Shawnee leaders signed a treaty in which they gave up their Ohio lands.

Some Shawnee refused to leave the area. Among them was Tecumseh, who organized a confederacy (group) of tribes to fight the Americans. Tecumseh died in battle in 1813. His confederacy fell apart soon afterward.

By the late 1800s most Shawnee had settled in Indian Territory (now Oklahoma). At the end of the 20th century there were more than 6,000 Shawnee. Most lived in Oklahoma.

Sheep

Sheep are among the most valuable of all domestic animals. Domestic animals are ones that have been tamed for use by humans. People eat sheep meat and drink sheep milk. The animals' wool is used to make cloth. Male sheep are called rams. Female sheep are called ewes. Sheep are closely related to goats.

There are more than 200 breeds of sheep. They are found on every continent except Antarctica. Sheep can be

A ewe watches over two lambs.

The Swaledale is an English breed of sheep with curling horns.

either wild or domestic. Most sheep like to live in high and dry areas.

Adult sheep weigh 80 to 400 pounds (35 to 180 kilograms). Some sheep have horns. They curl in loops alongside the head. Certain types of wild sheep have very long horns. The horns of the big-horn sheep can be more than 3.3 feet (1 meter) in length. Most domesticated sheep grow a thick coat of fibers called wool. Wild sheep grow both hair and wool.

Sheep eat grass and plants. They often graze in large groups, or flocks. Sheep have four separate stomach compartments, or sections. They regurgitate their food (bring it back up from the stomach) and chew it again. This helps the stomach fully digest the food.

People raise sheep for their meat, milk, and wool. The meat of an adult sheep is called mutton. Meat from a younger

sheep is called lamb. Some people drink sheep milk. It is also used to make cheese. Certain types of sheep are raised specifically for their wool. These include Merino and Rambouillet sheep.

Goat

Shell

Every empty seashell on the beach once contained an animal known as a mollusk. Clams, oysters, scallops, conchs, mussels, and snails are all types of mollusks. The shells of these animals are exoskeletons, or hard, outside skeletons that protect their soft bodies.

Structure

All mollusk shells are made of a mineral called calcium carbonate. To form a shell, the mollusk's body gives off substances that contain calcium carbonate. The substances harden into layers of shell. As the animal grows, its shell also gets bigger to make room for its body.

Shells come in many shapes, colors, and patterns.

Mollusk shells differ greatly in shape, size, color, and texture. The way a shell looks can help a mollusk avoid enemies. Bright colors or patterns may scare away enemies. Textures and colors that match the surroundings help a mollusk to hide from enemies.

Shells are also put together in various ways. Snails and conchs have single shells in the shape of a twisted cone. These mollusks are called univalves. Clams, oysters, scallops, and mussels have shells with two halves joined on one side. These mollusks are called bivalves. Chitons have shells made of eight overlapping plates.

Uses

The main purpose of a mollusk's shell is to protect its body. When in danger, a mollusk can quickly pull its entire soft body into the hard shell.

Shells have other purposes, too. Some shells have ridges that keep the animal anchored to the ocean floor. Other shells are smooth, which allows the animal to burrow easily into mud or sand. Shells with long spines trap food.

Many people collect shells. They may use them to make buttons and jewelry and in other crafts. In the past, peoples in Africa, North America, and the Pacific islands used shells as money.

Other Types of Shells

Some animals other than mollusks also have hard coverings called shells. Sea animals from the crustacean family—for example, crabs, lobsters, and shrimps—

have shells that do not grow. Turtles and tortoises have shells made from bone.

The covering of an egg is also called a shell. Eggshells protect developing birds and reptiles until they hatch. The coverings of many nuts and seeds are known as shells, too.

Shinto

Strips of paper with prayers written on them hang outside a Shinto temple in Japan.

More than 100 million people follow a system of religious beliefs and practices known as Shinto. They are called Shintoists. Most of them live in Japan.

The word Shinto means “the way of *kami*.” *Kami* are superior powers that Shintoists honor. They may be natural objects and creatures (such as the spirits

Did You Know?

About 100,000 different shell-making mollusks are known to exist.

of mountains and animals), worthy human beings (such as emperors), or gods and goddesses. Shintoists believe that the *kami* are the source of human life. The *kami* reveal truth to people and guide them.

One of the most important *kami* is the sun goddess, Amaterasu. Shintoists believe that she was the ancestor of the first emperor of Japan. A major Shinto shrine, or place of worship, in the city of Ise honors this goddess.

Shinto does not have a central book to guide followers or regular weekly services. Shintoists can visit shrines any time they wish. Some people go every day. Many Shintoists also practice Buddhism. Some houses have both Shinto and Buddhist altars set up for prayer.

Festivals during the year bring Shintoists together. There may be cleansing rituals, food offerings, prayers, music, and dance. Major celebrations include a kind of thanksgiving and a new year festival.

Little is known about Shinto's origins. It was already strong by the time Buddhism came to Japan in the AD 500s. The two religions mixed for hundreds of years.

In the late 1800s the Japanese government made Shinto the main religion of Japan. It encouraged people to worship at Shinto shrines. It made people believe that the emperor of Japan was a god.

These efforts ended in 1945, after Japan's loss in World War II.

Ship

A ship is a large boat that can carry passengers or cargo for long distances over water. People have been using ships for transportation, exploration, and war since ancient times.

Parts of a Ship

Most ships are much larger than most boats, but they have many of the same parts. As on boats, the front of a ship is called the bow. The back is the stern. A ship's left side is known as the port side. The right is the starboard side.

A ship's frame, or body, is called the hull. The keel is like the ship's backbone. It is a central beam that runs along the bottom of the ship from front

A cargo ship loaded with freight containers passes the Golden Gate Bridge near San Francisco, in the U.S. state of California.

Many airplanes can be seen on the flight deck of an aircraft carrier.

to back. The keel keeps the ship from tipping over.

Ships usually have many decks. The decks are like the floors of a building. Cabins for passengers, engine and control rooms, and spaces for cargo are often on different decks.

An engine inside the ship provides energy to propellers at the back of the ship. The propellers push the ship through the water. The rudder, which is also at the back of the ship, helps in steering. When the ship is not moving, a heavy metal anchor may be lowered into the water. This keeps the ship from floating away.

Types and Uses of Ships

People use different types of ships for many different purposes. Some of the main types are trade ships, warships, industrial ships, and pleasure vessels, or cruise ships.

Trade ships carry different types of cargo. Container ships carry cargo pack-

aged in large containers. General cargo ships carry lumber, farm products, and other goods that are hard to ship in containers. Bulk ships carry coal, grains, and other loose cargo. Tankers carry oil and other liquid cargo. Refrigerated ships, or reefers, carry meat, fish, and other products that need to stay cold.

Navies use several different kinds of warships. The largest are aircraft carriers. A carrier has a large flat surface called a flight deck that airplanes can use for takeoffs and landings. Other types of military ships include cruisers, destroyers, and submarines. Submarines are ships that can travel underwater.

Industrial ships are sometimes called factory ships. Some industrial ships are oil rigs. They have big machinery that pumps oil from the ocean floor. Another type of factory ship processes fish that the crew catches at sea.

A cruise ship towers over pleasure boats in a harbor.

Before airplanes made long-distance travel quick and easy, people traveled in ships called ocean liners. Ocean liners had dining rooms and cabins where guests could sleep. Today this type of ship is called a cruise ship. Cruise ships carry tourists and vacationers to seaside locations around the world.

History

In early times people moved ships with oars. Many early ships also used the wind to move across the seas. These ships had sails—large, raised pieces of cloth that caught the wind. Ancient Egyptian warships had at least 40 oars and a single sail. The powerful longships of the Vikings also had oars and one sail.

By the 1400s European ships had several sails. Sailing ships known as galleons carried large guns along their sides for making war. In the 1800s long, slim ships called clippers also had several sails.

Ships were made mainly of wood until the middle of the 1800s. At that time iron ships began to replace wooden ones. Steam-powered engines also began to replace sails.

Today most ships are made of steel or other modern materials. They have internal-combustion engines that run on diesel fuel or gas. Some modern ships run on nuclear power.

Shoshone

A photograph from about the 1890s shows a Shoshone man named Heebe-tee-tse.

The Shoshone (or Shoshoni) are Native Americans of the western United States. They are historically divided into four groups. The Western Shoshone traditionally lived in what are now Nevada, California, and Utah. The Northern Shoshone lived in what are now Idaho, Utah, Montana, and Oregon. The Wind River (or Eastern) Shoshone lived in what is now Wyoming. The Comanche were part of the Wind River Shoshone before they split off and moved to what is now Texas.

The Western Shoshone ate mostly roots, nuts, seeds, fish, and small animals. Some Western Shoshone built huts covered with brush or bark mats. Others lived in caves.

The Northern Shoshone fished and collected wild roots. The Wind River Shoshone hunted for food. By 1700 the Northern and Wind River Shoshone had gotten horses. They began to travel to the Great Plains to hunt bison (buffalo). There they started to use tepees covered with bison skins for housing.

The U.S. explorers of the Lewis and Clark Expedition visited the Shoshone in 1805. Soon after that fur traders, Mormon settlers, and miners began arriving in the Shoshone territory. By the mid-1800s many Shoshone had died from diseases brought by the newcomers.

The U.S. government pressured the surviving Shoshone to move to reservations. At the end of the 20th century there were about 10,000 Shoshone living in the United States.

A shrew looks out from its burrow.

Shrews are among the world's smallest mammals. Some measure only 2.5 inches (6.4 centimeters), including the tail. Shrews have brownish gray fur and sharp teeth. A pointed snout overhangs the lower lip. Shrews have bad eyesight but a good sense of smell.

Some shrews are active both day and night. Others are active only at night. Shrews usually eat more than their body weight in food each day. Some birds of prey and snakes eat shrews. However, most animals will not eat shrews because shrews can give off a bad smell.

A female shrew gives birth to 2 to 10 young at a time. The furless, blind babies mature quickly. Most shrews live only one to three years.

► More to explore

Mammal

Shrew

The animals called shrews look like mice. But unlike mice, shrews are not rodents. Instead shrews belong to a group of insect-eating mammals called insectivores. There are more than 300 species, or types, of shrew.

Shrews live mostly in moist places north of the equator. They hide in the grass or dig underground burrows. Except when mating, shrews live alone.

Did You Know?

Shrews are nervous creatures. Shock from a loud noise or a rough touch can kill them.

Sierra Leone

Sierra Leone is a small country on the coast of West Africa. Its name means “lion mountains.” It was named for the hills that surround the country’s main harbor. The capital is Freetown.

Geography

Sierra Leone shares borders with Guinea and Liberia. The Atlantic Ocean lies to the west. Most of the coast is flat and swampy. The northern coast has some mountains. Central Sierra Leone is flat in the north and hilly in the south. Mountains rise in the east. The climate is hot and humid.

Plants and Animals

Grasslands cover the north. Forests grow on the hills and mountains. Palm trees are common. Sierra Leone’s animals include monkeys, chimpanzees, tigers, porcupines, antelope, and crocodiles.

People

The largest groups of people are the Mende and the Temne. Creoles form a small group. Their ancestors were slaves who returned to Sierra Leone after being freed. Most of the people speak Krio, a mixture of English and African languages. About half of the people follow Islam. Many others follow traditional African religions. Most of the people live in the countryside.

Economy

Sierra Leone is a very poor country. Most people are farmers. Crops include rice, cassava, peanuts, and sweet potatoes. Sierra Leone has rich supplies of diamonds.

History

People have lived in what is now Sierra Leone for thousands of years. Portuguese explorers arrived in the 1400s. In the late 1700s and early 1800s the British helped freed slaves settle on the coast. The settlement became known as Freetown. During the 1800s the British took control of the area.

Sierra Leone gained independence from Great Britain in 1961. From 1991 to 2002 rebel groups fought a war against the government. The civil war forced hundreds of thousands of people to leave the country.

Sierra Nevada

The mountain range called the Sierra Nevada has some of the highest peaks in the United States. It runs along the eastern edge of California. It also reaches into western Nevada. Sierra Nevada is a Spanish name that means “snowy range.”

The Sierra Nevada is about 400 miles (640 kilometers) long. Its highest peak is Mount Whitney, at 14,494 feet (4,418 meters). Mount Whitney is the highest mountain in the United States outside of Alaska.

Winds from the west bring warm air from the Pacific Ocean to the mountains. The winds also carry a lot of moisture. Most of the moisture falls as rain or snow on the western slopes. The eastern slopes are dry.

Evergreen forests on the western slopes include cedars, pines, and firs. The best-known trees of the mountains are giant sequoias. They are the largest trees in the

world. The dry eastern slopes have sagebrush, juniper, and aspen.

Black bears and a few grizzly bears live in the Sierra Nevada. Smaller mammals of the mountain forests include American badgers, bobcats, flying squirrels, and golden beavers.

Native Americans once lived in the Sierra Nevada. The first Europeans to arrive were Spanish explorers and missionaries. They visited in the 1700s. In 1848 settlers found gold nuggets in mountain streams. That discovery started the California gold rush. Fortune seekers came to the area from all over the world.

Today tourism is the most important part of the region’s economy. Yosemite, Kings Canyon, and Sequoia national parks attract tourists with their beautiful scenery. Lake Tahoe is also popular with visitors.

Sign Language

A teacher uses sign language to communicate with her hearing impaired students.

Through hand movements rather than speech, people using sign language can communicate their thoughts and feelings. Around the world there are more than 100 sign languages, which are mainly used by deaf people. Most deaf people in North America use American Sign Language (ASL).

What Is Sign Language?

People using sign language make shapes, called signs, with their hands and arms. They also move their bodies and make facial expressions. Signs can stand for letters, words, or ideas. For example, to make the sign for cat, ASL users hold their hands up to their faces and “draw” whiskers with their fingers.

Sign languages are unique languages. ASL has different rules of grammar and different slang than spoken English. ASL

is also different from other sign languages, including British Sign Language and Mexican Sign Language.

History

Throughout history both hearing and deaf people have used some signs to communicate. For example, babies quickly learn to point at things they want. Often people use a system of signs to communicate with others who speak different languages.

In the 1700s a priest in France taught deaf children a system for spelling out French words with hand gestures. The system became French Sign Language.

In 1817 Thomas Hopkins Gallaudet founded the first permanent school for the deaf in the United States. He had learned French Sign Language from a teacher in France. Gallaudet taught his students the French signs. ASL was formed by combining Gallaudet’s teachings with signs that deaf people already used among themselves.

Did You Know?

Native Americans who could not understand each other’s languages used sign language to communicate.

Sikhism

Sikhism is a religion of India that was started by a man named Nanak. He was the first of the 10 gurus, or teachers, of the Sikhs. Most Sikhs live in the state of Punjab in northwestern India.

Sikhs believe that there is one God. All people are considered equal and have the opportunity to become one with God.

A Sikh leader reads from the *Adi Granth*.

But first they must overcome self-centeredness by honoring God, working hard, and sharing with others.

Many Sikhs belong to the order called the Khalsa. Members of the order avoid alcohol, tobacco, and drugs and devote themselves to prayer. The men carry swords. They must not cut their hair or beards and must cover their hair with a headdress called a turban.

The main Sikh temple is the Hari-mandir, or Golden Temple, in Punjab state. The Sikh religious book is called the *Adi Granth* (First Book). It contains nearly 6,000 hymns, or songs praising God, written by Nanak and other gurus.

According to Sikh tradition, in the late 1400s Nanak saw a vision of God, who ordered him to begin preaching. Nanak attracted many followers and became the first of the 10 gurus. The last human guru was Gobind Singh, who died in 1708. Gobind Singh created the Khalsa as an armed brotherhood. He felt that Sikhs were being mistreated by India's rulers. He was succeeded as guru by the

Adi Granth, or *Guru Granth Sahib* (Guru Granth Personified).

In the 1840s the Sikhs fought two wars with British forces in the Punjab region. The British controlled India at the time. The Sikhs were defeated, and the Punjab became part of British India.

In 1947 British India gained independence as two separate countries, India and Pakistan. The traditional lands of the Sikhs were divided between the two. Most Sikhs settled in India, but the Sikhs and India's Hindu majority quarreled. In 1984 Indian soldiers killed hundreds of Sikhs in an assault on the Golden Temple. Later that year the Indian prime minister was killed by two of her Sikh bodyguards. The murder led to more violence against Sikhs. Because of this, many Sikhs began demanding the establishment of a separate Sikh state. In 2004 Manmohan Singh, a Sikh, was appointed prime minister of India.

India

Silk

Silk is a valuable fiber made mostly by insects called silkworms. It is used to make high-quality clothing, sheets, and other things.

Natural Silk

Silkworms are actually caterpillars, not worms. A silkworm builds a case called a cocoon around itself for protection while it changes into a moth. It makes

the cocoon with silk that comes out of a tube in its head. The silkworm wraps a single long strand of silk around itself over and over again.

Some spiders also make silk. They weave silk webs to catch insects to eat. However, the silk made by spiders is too thin for making cloth.

The Silk Industry

In the silk industry, silkworms are raised from the time they are eggs until they have made a cocoon. In nature, a silkworm breaks open its cocoon to come out as a moth. Silkworms used for industry are killed with hot air or steam inside the cocoon. This way the cocoon is not damaged.

To process silk, the cocoons are first put in hot water. This softens the cocoons so the silk can be unwound. Several cocoons are unwound at the same time to form a single strand. Then several strands are twisted together to make

A silkworm spins its cocoon.

thicker, stronger yarn. The yarn can be dyed and woven into cloth.

History

The silk industry began in China more than 4,500 years ago. The Chinese traded silk but would not tell other countries how it was made. Silk was such an important product that the trade route between China and Europe was called the Silk Road. In the AD 500s silkworms were stolen from China.

Silk cloth is strong and warm but light in weight. It resists wrinkling and can be dyed with bright colors.

Then Europeans started making silk themselves.

Today artificial fibers are often used instead of silk. But people still value silk items because of their quality. China remains a major silk producer.

Silverstein, Shel

Shel Silverstein's books, including *The Giving Tree* and *Where the Sidewalk Ends*, are some of the most famous children's books of all time. Silverstein also wrote books for adults as well as songs and plays, but he is remembered mostly for his work for children.

Early Life

Sheldon Alan Silverstein was born in Chicago, Illinois, on September 25, 1930. When he was about 12 years old, he became interested in writing and drawing. In the 1950s he served in the U.S. military. During that time, Silverstein worked as a cartoonist for the military magazine *Stars and Stripes*.

Career

Silverstein began writing books for children in the early 1960s. These included *Lafcadio, the Lion Who Shot Back* (1963) and *Who Wants a Cheap Rhinoceros* (1964). *The Giving Tree* (1964) made him famous with children and parents across the country. The book tells the story of a tree that gradually gives a boy everything it has. Other popular Silver-

The Giving Tree is a much-loved book by Shel Silverstein. The story is about the relationship between a boy and a tree. Silverstein also drew the pictures.

stein stories include *The Missing Piece* (1976) and *The Missing Piece Meets the Big O* (1981).

Silverstein also wrote poems. In his serious poems he showed that he understood how children think and what they think about. His humorous verse features comical scenes and fun-to-say words and rhymes. His most famous books of poetry are *Where the Sidewalk Ends* (1974), *A Light in the Attic* (1981), and *Falling Up* (1996).

Silverstein died on May 10, 1999, in Key West, Florida. Some poems he had not yet published appeared in a new book, *Runny Babbit: A Billy Sook*, in 2005.

Did You Know?

Shel Silverstein was also a musician. He wrote "The Unicorn" and many other songs.

Singapore

Singapore is a small, wealthy island country in Southeast Asia. The capital city, also called Singapore, is so large and important that the country is often called a city-state.

The island of Singapore lies south of the mainland part of Malaysia. A narrow body of water separates the countries. Singapore's land is mostly low and flat. Its weather is hot, humid, and often rainy.

Some rain forests grow in the center of the island. Shrubs and grasses are more common. The animals of Singapore include the long-tailed macaque (a type of monkey) and the slow loris (a tailless primate).

Most people in Singapore are Chinese, Malay, or Indian. The Chinese make up about three quarters of the population. Most of the Chinese are Buddhist, Daoist, or Christian. The Malays and some

© 2006 Encyclopædia Britannica, Inc.

A statue of a merlion serves as a symbol of Singapore. A merlion is an imaginary creature that is half lion and half fish.

Indians follow Islam. Most Indians practice Hinduism. Singapore has four national languages: Malay, English, Chinese, and Tamil (a language of India).

Banking, communications, and other services are very important to the economy. Singapore also produces electronics, chemicals, machinery, petroleum (oil) products, and other goods. There is little space for farming. Singapore buys most of its food from other countries.

In early times traders traveling between India and China often passed through Singapore. The British took control in the 1800s. By 1959 Singapore had its own government. In 1963 Singapore joined Malaysia. Two years later Singapore separated from Malaysia to become fully independent.

Sioux

The Sioux are a group of Native American peoples who speak similar languages. There are three main divisions of the Sioux: the Dakota (or Santee), the Nakota (or Yankton), and the Lakota (or Teton).

The Sioux originally lived near Lake Superior in what is now Minnesota. They hunted, fished, farmed, and gathered wild rice and beans.

In the middle of the 1700s wars with the Ojibwa drove the Sioux westward. The Dakota settled in southern and western Minnesota. They kept living as they had before.

The Nakota and the Lakota moved onto the Great Plains. The Nakota settled in what are now North and South Dakota. The Lakota went farther

A photograph from the 1890s shows a Sioux holding a bow and arrows.

west, to the Black Hills region of western South Dakota and eastern Wyoming and Montana. The move changed their lifestyles. The Nakota and the Lakota started hunting bison (buffalo) on the plains. While on the hunt they lived in portable, cone-shaped tents called tepees. They ate bison meat and used bison skins to make tepees and clothes.

By the middle of the 1800s white settlers were moving westward into Sioux territory. The Sioux fought for many years to stop invasions of their land. Sitting Bull and Crazy Horse were famous Sioux chiefs who led the fight. In 1890 U.S. troops killed more than 200 Sioux at a place called Wounded Knee in South Dakota. The massacre ended the Sioux fight against the whites. By the end of the 1800s most Sioux had moved to reservations.

At the end of the 20th century there were about 108,000 Sioux in the United States. Many lived on reservations in Montana, Nebraska, North Dakota, and South Dakota. About 10,000 more Sioux lived in Canada.

Sitting Bull

Sitting Bull was a Native American who tried to keep U.S. settlers from taking over Indian lands. He is known for his role in the battle of the Little Bighorn.

Sitting Bull was a leader of the Sioux people. He was known for his bravery and wisdom.

In that battle he defeated a group of soldiers led by Lieutenant Colonel George Armstrong Custer.

Sitting Bull was a member of the Lakota, or Teton Sioux. He was born in about 1831 near the Grand River in what is now South Dakota. His Sioux name was Tatanka Iyotake. He was named chief of the entire Sioux nation in about 1867.

Sitting Bull spent many years battling U.S. soldiers. Tensions increased when gold was found on Sioux lands. The U.S. government soon ordered the Sioux to move to reservations. Sitting Bull, however, prepared to fight the move. On June 25, 1876, U.S. soldiers led by Custer attacked the Indians. The battle took place in the valley of the Little Bighorn River. When the fighting ended, Custer and all of his soldiers were dead.

Sitting Bull won many more battles. But he and his people were eventually forced to surrender.

Sitting Bull toured for a time with Buffalo Bill's Wild West Show. He later settled on a reservation but remained outspoken. Soldiers arrested him because they were afraid he would stir up trouble. He was killed on December 15, 1890, as his warriors were trying to rescue him.

Skateboarding

A skateboard is a small board with wheels on the bottom. A skateboarder stands on the board as it rolls. The skateboarder stays balanced by shifting the

A professional skateboarder wears a helmet and padding while performing a difficult stunt on a closed-off ramp. Skateboarders should stay safe at all times.

Did You Know?

American skateboarder Tony Hawk helped make the sport popular in the 1980s and 1990s.

feet and body. Many young people enjoy skateboarding as a hobby. It is also an organized sport. The best skateboarders can invent and perform difficult tricks.

Most skateboards are about 32 inches (81 centimeters) long and 9 inches (23 centimeters) wide. The back end of a modern skateboard is bent upward. This is called the kicktail. The wheels are made of a special kind of tough plastic.

Skateboarding Styles and Events

The two main styles of sport skateboarding are vertical (or vert, for short) and street style. Vertical skaters jump off ramps or perform in U-shaped riding surfaces called half-pipes. They do tricks in midair. Street-style skaters perform in city environments. They ride their skateboards over objects such as steps, railings, and ledges.

These styles of skateboarding have been organized into competitions. Events are held in Australia, Brazil, Canada, and the United States, and throughout Europe and Asia. Skateboarding is also a part of the televised sports festival called the X Games.

History

The first skateboarders made their own boards in the early 1900s. The simplest homemade skateboards had roller-skate wheels attached to a board.

Skateboarding became popular in the early 1960s. It developed among surfers in California, in the United States. Surf-

ers use special boards to ride on waves in the ocean. When there were no good waves for surfing, some surfers changed their boards. They added wheels so they could ride on the sidewalks near the ocean. Skateboarding was even called sidewalk surfing.

The first skate parks were built in the 1970s. They had slopes and banked surfaces for sudden turns and stunts. But some skateboarders chose to skate in empty swimming pools. This was the beginning of vertical skateboarding. Soon skateboarders started riding in half-pipes. Street-style skating started in the 1980s.

Skating

Skating is a form of sport that has three main types: ice skating, roller skating, and skateboarding. Ice skating is the

Many people enjoy skating as a casual form of entertainment. For others it is a serious sport.

oldest form of skating. Thousands of years ago people used animal bones as skates to cross frozen bodies of water. Modern ice skates are shoes or boots with metal blades attached. Ice skating has three main divisions: figure skating, speed skating, and ice dancing. The team sport of ice hockey also involves skating.

Roller skates have wheels instead of blades. Indoor types of roller skating include roller dancing, figure skating, and speed skating on hardwood, plastic-coated tracks. Roller hockey is usually played outdoors. In the 1980s roller skaters started to use in-line skates, or Rollerblades. They are faster than traditional roller skates.

Skateboarding is a popular sport that began in the U.S. state of California in the early 1960s. Young people started skateboarding on pavement near beaches when the ocean was too calm for surfing. A skateboard is like a small surfboard with wheels. Skateboard parks provide a variety of slopes and surfaces for riding.

Skeletal System

The collection of bones in an animal's body is called a skeletal system, or skel-

Fish, birds, reptiles, and mammals are four types of animals that have skeletons inside their bodies. The skeletons of a perch, a chicken, a crocodile, and a cow are shown.

The human skeleton is mostly bone but has some cartilage. The skeleton supports and protects the body.

eton. Mammals, birds, reptiles, amphibians, and fish have skeletal systems. Insects and shellfish do not have skeletons inside their bodies. Instead they have hard, outside coverings called exoskeletons. The skeletons of corals and sponges are made of stony minerals, not bone. Some animals, such as jellyfish, have no skeleton at all.

The human skeletal system has more than 200 bones. The hard, stiff bones of the skeleton support the whole body. The skeleton also protects the soft organs inside the body. In addition, the skeleton works with the muscles to allow the body to move.

Support

The most basic job of the skeletal system is support. For example, the spine, or vertebral column, supports the entire upper part of the body. The human spine lets people stand and walk in an upright position, or posture. Humans enjoy great advantages over other animals because of this posture. Because humans use only their legs for walking, their arms are free for useful activities, such as using tools.

Protection

The second major job of the skeletal system is protection. The skeleton's rigid structure protects the body's soft organs. For example, the rib cage formed by the spine and the ribs protects the heart, the lungs, and other organs in the upper body.

The skeletal system also protects the central nervous system, made up of the

brain and the spinal cord. Inside the head, the skull surrounds and protects the brain. The vertebrae, or bones of the spine, surround and protect the nerves of the spinal cord.

Movement

The third major job of the skeletal system is movement. The skeleton works with the muscles to allow the body to move in many different ways. Many muscles are attached to at least two bones in the skeleton. When the brain tells a muscle to move, the muscle pulls on or pushes its attached bones.

How the Skeletal System Is Connected

Tough, leathery tissues called ligaments hold together the bones of the skeleton. Muscles also hold together some of the bones. In most cases, however, a cord called a tendon connects muscles to bones.

A view of a knee joint shows the different kinds of connective tissue that hold together the human skeleton.

At the points where bones connect, the bones have a protective covering called cartilage. If two hard bones constantly rubbed together without this covering, they would wear down and become damaged. Cartilage is tough enough to protect the bones but elastic enough not to become damaged itself. It is found at the ends of many bones and in joints, such as the knees and the hips. Cartilage also connects parts of the rib cage. The cartilage allows the ribs to move in and out during breathing.

Cartilage can be damaged, however, and it is not easily repaired. As people get older, the cartilage in some joints can wear down. This allows the bones of the joints to rub together painfully. In such cases doctors can replace the joints with artificial joints made of plastic or metal.

Skiing

Skiing is a winter sport that involves the use of skis. Skis are long, mostly flat strips of metal, wood, or plastic. Skiers attach them to their shoes or boots and use them to glide over snow, often down a mountain slope. Many people ski for fun. Skiing can be fast and exciting, but it can also be dangerous.

Skiing events are a major feature of the Winter Olympic Games. Four types of skiing events are held at the Olympics:

Did You Know?

An infant's skeleton is made of cartilage that is gradually replaced by bone as the infant grows into an adult.

A skier speeds down a winding course in a type of racing called slalom. Poles called gates mark the course. Skiers are allowed to touch gates with their bodies, as long as their skis stay on the course.

Nordic, Alpine, freestyle, and snowboarding. In the first three types, skiers wear a ski on each foot. The skiers usually hold two poles, which they use to keep their balance or push themselves along. Snowboarders stand with both feet on a single ski, called a snowboard. They do not use poles.

Nordic Skiing

Nordic skiing started in Norway and other countries of northern Europe. Nordic skiing events include cross-country racing and ski jumping. Cross-country skiing takes place on open, hilly land. A cross-country skier must be able to ski uphill, downhill, and across flat areas.

In a ski-jumping competition the skier slides down a steep ramp that curves upward at the end. The skier leaps off the end and tries to “fly” as far as possible and then land on his or her feet. The skier who leaps the farthest and has the best form, or style, is the winner. The event called the Nordic combined includes a ski-jumping contest and a cross-country race.

Alpine Skiing

Alpine skiing started in the Alps mountains of central Europe. Alpine

There are four types of courses for Alpine skiing races. A downhill skier's path, left, is long and steep. A slalom skier, right, faces many tight turns. Giant slalom and super-G, center, combine features of slalom and downhill.

events include downhill and slalom racing. Downhill racing is the fastest and most dangerous of all skiing events. The skier goes down a long, steep course that may have ruts and large bumps. Along the course are gates formed by single poles or pairs of poles. The skier must ski between the gates and stay on the course. The winner is the skier who completes the course in the shortest time.

Slalom racing is similar to downhill racing. However, a slalom course is shorter and more winding than a downhill course. The slalom course requires the skier to make high-speed turns. The giant slalom and the supergiant slalom, or super-G, take place on longer versions of a slalom course.

Freestyle Skiing

Freestyle skiing combines skiing and acrobatics. There are three freestyle events: acro, aerials, and moguls. An acro skier performs jumps, flips, and spins while skiing on a gently sloping hill. An aerial skier does similar tricks in the air after jumping off a ramp. A mogul skier races over and around large bumps of snow, called moguls. The mogul skier also makes two jumps and does tricks in the air. In freestyle events judges score the skiers on different skills.

Snowboarding

Snowboarding developed in the United States from the sports of surfing and skateboarding. It is like surfing on snow. A snowboard looks much like a skateboard without wheels.

Freestyle Skiing

A freestyle skier on a moguls course goes over many bumps. On an aerials course, the skier jumps from a ramp to perform flips and twists in the air.

Snowboarding has slalom, giant slalom, and supergiant slalom (or super-G) competitions. These events are similar to the Alpine slalom events. The snowboarder who completes the course in the shortest time is the winner.

There are also freestyle snowboarding events. They take place on a half-pipe, which is a ramp built from snow. The ramp looks like the lower half of a huge flat-bottomed tube with one open end.

Snowboarding

A snowboarder on a half-pipe course goes back and forth from one side of the half-pipe to the other.

Snowboarders ski from side to side of the ramp, picking up speed. They fly up from the top of the ramp and do tricks in the air. Judges rate the performances.

History

Skis found in Sweden and Finland are thought to be between 4,000 and 5,000 years old. A rock carving of two men on skis, found in Norway, dates from 2000 BC. People in China have skied since at least the AD 600s. Skiing was used in warfare in Norway as early as 1200. Troops in Sweden, Finland, Russia, and Poland also used skis.

Cross-country is the oldest form of sport skiing. Cross-country competitions

began in Norway in the 1840s. By the 1860s skiing had reached the U.S. state of California. Ski-jumping competitions began in the 1870s. Nordic skiing events were a part of the first Winter Olympics, held in 1924.

Alpine skiing developed during the late 1800s and early 1900s. Alpine events became a part of the Olympics in 1936.

Freestyle skiing and snowboarding are newer events. Mogul and aerial skiing were added to the Olympics in the 1990s. Snowboarding events were first held at the 1998 Olympics.

Olympic Games

Skin

Skin is the outer covering of humans and all other animals with a backbone. It protects the body from germs, injuries, and extremes of hot or cold.

The skin of some animals has special features that provide more protection. Birds, for example, have feathers attached to their skin. Fish and reptiles have plates called scales over their skin. Most mammals have a thick coat of hair called fur. Humans have hair on their skin, too, but not enough to act as protection.

Human skin has three layers. The epidermis is the thin outer layer. Dead cells of the epidermis constantly flake off as new ones form. Cells in the epidermis produce a substance called melanin. Melanin creates different skin colors. The epidermis has cells that make nails, too.

The middle skin layer is called the dermis. It is thicker than the epidermis, which it supports and strengthens. The dermis has fibers that make the skin tough and stretchable. Pits in the dermis, called follicles, make hair. The dermis also contains blood vessels and nerves. Nerves are fibers that send information picked up by the senses to the brain.

The third, deepest layer of the skin is made up mostly of fat. This fat supplies nutrients to the other two layers. It also cushions the body and protects it from the cold.

Human skin has three layers: the epidermis, the dermis, and a layer made mostly of fat. Hair follicles, oil glands, sweat glands, nerves, and blood vessels lie beneath the surface of the skin.

The body releases some substances through the skin. Sweat glands send a watery liquid called sweat through pores, or tiny openings, on the skin's surface. Sweat cools the body. Other glands in the skin produce an oil that can give the skin a slightly greasy surface. This oil helps keep the skin flexible.

Skin can be irritated or damaged in a number of ways. Viruses can cause skin blisters known as shingles. Extra oil production can cause a condition called acne. Skin burns can be caused by fire, chemicals, electric shock, or the sun.

Skopje

Population
(2004 estimate)
506,930

Skopje is the capital of Macedonia, a country in southeastern Europe. The city lies on the Vardar River. It is Macedonia's largest city by far.

Skopje is Macedonia's center of business and industry. Factories in the city process foods, cement, metals, and other products. Trade, banking, tourism, and other services are also important.

People called the Illyrians founded Skopje in ancient times. By the 300s the city was the capital of a province of the Roman Empire. In 518 an earthquake destroyed the city, but it was rebuilt. The Serbs conquered Skopje in 1189. The Turkish Ottoman Empire controlled the Macedonia area from 1392 until 1912.

In the early 1900s Skopje and the rest of Macedonia became part of the country of Yugoslavia. In 1963 an earthquake destroyed most of the city. Skopje was rebuilt with many modern buildings. In 1991 Macedonia became an independent country. Skopje was its capital.

Macedonia

Skull

In animals with a backbone, including human beings, the skull forms the hard part of the head. It surrounds and protects the brain. The skull is a part of the body's skeletal system.

Front View

Side View

The human skull must be large enough to protect a large brain.

The skull is made up of several bones that are joined together like a jigsaw puzzle. Many of the other bones of the body meet at movable joints. The bones of the skull, however, meet at joints that do not move. (The lower jawbone, which does move, is not really a part of the skull.)

The cranium is the part of the skull that covers the brain. The human cranium is noticeably larger than the part of the skull that makes up the face. In most other animals the opposite is true—the face is larger than the cranium.

Openings in the skull let air move through the nose. Other openings form eye sockets that support and protect the eyes. The spinal cord, which is the body's main nerve, enters the skull through an opening at its bottom. Nerves from the eyes, the nose, the ears, and the tongue pass through smaller openings on their way to the brain.

The skull rests on the atlas, which is the topmost vertebra, or bone, of the spine. This allows the skull to nod up and down. The atlas can turn on the vertebra directly beneath it. This allows the skull to turn from side to side.

Skunk

Skunks are black and white mammals known for the foul-smelling spray they release when threatened. When a skunk

The striped skunk is a common skunk of North America.

feels trapped or in danger, it showers this spray on the creature that threatens it.

Skunks are found throughout the Americas. They live in many different places, including woods, grasslands, deserts, and mountains. Many skunks are comfortable in towns and cities.

Skunks are usually the size of a house cat, though some are much smaller. They have a bushy tail. Skunks have different patterns of black and white in their fur. One common pattern is black with a white patch on the head and one or two white stripes on the back. Other skunks have a mostly white back and tail or white spots in black fur.

Most skunks are active at night. They eat insects, eggs, small rodents, birds, and fruits. When a skunk feels threatened, it lifts its tail and stamps its feet. If this does not chase away the enemy, the skunk sprays its smelly liquid. It can shoot this liquid as far as 12 feet (3.7 meters). A skunk usually aims the spray

at the eyes of its enemy. This blinds the enemy temporarily, letting the skunk escape.

Skyscraper

A skyscraper is a very tall building with many stories, or floors. Early skyscrapers had 10 to 20 stories. Today some skyscrapers have 100 stories or more.

Two developments in the middle of the 1800s helped to make the modern skyscraper possible. The first was a process for making large amounts of steel. The second was the invention of the passenger elevator.

Before this time brick or stone walls alone carried the weight of upper stories. The tremendous weight of each story made it impossible to build very high. Some architects (people who design

A cluster of skyscrapers stands near the Singapore River in Singapore.

Four of the world's tallest buildings are shown side by side. The Willis (formerly Sears) Tower and the Empire State Building have antennas that do not count as part of the height. The Taipei 101 is located in Taipei, Taiwan. The Petronas Towers 1 & 2 are found in Kuala Lumpur, Malaysia. The Willis Tower is in Chicago, Illinois, and the Empire State Building is in New York City.

buildings) used an iron frame to support taller buildings. But even these buildings were not much higher than four or five stories.

In the 1860s steel became widely available. This metal is both stronger and lighter than iron. Architects could now use a steel skeleton to support very tall buildings. Chicago's Home Insurance Company Building was the first skyscraper to use this type of steel construction. Built in 1884–85, it was 10 stories high.

Skyscrapers would not have been useful without elevators. People could not

regularly walk up and down more than five or six flights of stairs. In 1853 a U.S. inventor named Elisha Graves Otis introduced an elevator safe enough to carry passengers.

During the 1920s and 1930s skyscrapers rose to greater heights than ever before. For many years the Empire State Building (completed in 1931) in New York City was the world's tallest building. It is 1,250 feet (381 meters) tall and has 102 stories. Today several skyscrapers are even taller.

Slavery

The practice of people owning other people is called slavery. The owned people are called slaves. They have to work for the owners, doing whatever the owners ask them to do. In the past, many societies had slavery. Now almost all societies consider slavery to be wrong. They consider personal freedom to be a basic human right.

The Lives of Slaves

People became slaves in many ways. Some became slaves after being captured in wars or raids. Others became slaves because they had committed crimes or could not pay their debts. Some people were sold into slavery by their relatives. Others were the children of slaves.

Different societies had different rules for slavery. Many slaves of the Muslims, for example, had to be freed after six years.

Slaves in the United States, however, stayed slaves forever. They could not own any property. Their marriages were not legal, and their families could be broken up at any time. There were laws against killing or mistreating slaves, but governments did not always enforce these laws.

Slaves got no pay, had no choice of jobs, and were not allowed to quit. Other kinds of workers had limits on their freedom but were still freer than slaves. Serfs were farmworkers who were legally tied to the land on which they worked. They received no pay and were not free to move away, but they could not be bought or sold like slaves. Indentured servants were people who agreed to work for a master for a certain period of time. People became indentured servants to pay their debts.

Slaves did a variety of jobs. Most slaves worked on farms. Many did cooking, cleaning, child care, and other house-

A monument honors enslaved Africans who died in 1830. Their ship sank off the coast of Martinique, an island in the West Indies.

hold services for the families that owned them. Others worked to make money for their owners. Some slaves worked in mines.

Early Slavery

Slavery existed throughout the ancient world. It was practiced in China before 1200 BC. There were laws about slaves in the Middle East from about 1750 BC and in India from about 100 BC.

In Athens, a city of ancient Greece, about one third of the people were slaves. In ancient Rome, slaves worked on farms, rowed warships, did construction work, or copied out books. In the later days of the Roman Empire, slaves on farms eventually became serfs.

In the early Middle Ages, after about AD 500, Europeans took many Slavs (a people of eastern Europe) as slaves. The word slave comes from “Slav.” Serfs slowly replaced slaves in all of Europe. There were serfs in parts of Europe into the 1800s.

Enslaved Africans

Slavery also existed in Africa in ancient times. But the African slave trade across the Atlantic Ocean began in the early

1500s. European ship captains bought slaves from African traders. The ships then usually carried the slaves to Brazil or a Caribbean island. Conditions on slave ships were terrible, and many people died.

Those who survived were sold to owners in many parts of the Americas. Owners put Africans to work in mines or on large farms that grew tobacco or sugar. The farms needed African slaves to replace Native American workers. European diseases had nearly wiped out these Native Americans.

The first African slaves in North America arrived in the English colony of Virginia in 1619. All the British colonies permitted slavery, but the large farms that used the most slaves were in the South. At first, tobacco was the most important crop. Then, in 1793, Eli Whitney invented a machine called the cotton gin. His invention made cotton easier to process. This led to a huge demand for African slaves to work on large cotton farms called plantations.

Ending Slavery

During the 1700s some people in Great Britain came to think that slavery was

Enslaved Africans had no room to move on a ship that took them across the Atlantic Ocean.

wrong. They began the abolitionist movement, an effort to end slavery. Both Britain and the United States banned the slave trade in the early 1800s. Starting with Vermont in 1777, the northern parts of the United States banned slavery entirely.

However, the large Southern plantations continued to rely on slave labor. Some slaves escaped through a secret organization called the Underground Railroad, but the system of slavery survived. In some states more than half the people were slaves.

The big issue that divided the United States was whether slavery would be allowed in new territories and states. The Missouri Compromise of 1820 settled the problem for a time. It allowed slavery in some new territories but not others. However, the Kansas-Nebraska Act of 1854 allowed the people in new territories to choose to have slavery. In the Dred Scott case of 1857, the U.S. Supreme Court ruled that the government did not have the power to ban slavery in the territories. In 1861 the American Civil War began, partly over the issue of slavery. At the end of the war, the 13th Amendment to the Constitution finally put an end to slavery in the United States.

In Central and South America, as soon as colonies gained independence, they often banned slavery. The last country in the Western Hemisphere to end slavery was Brazil, in 1888.

Small houses on the grounds of a Southern plantation were once the homes of slaves.

By the late 1800s the British abolished slavery in India and in the parts of Africa that they controlled. Slavery ended in China in 1910.

Some parts of Africa and the Islamic world practiced slavery well into the 1900s. Although all countries had officially outlawed slavery by the end of the 1900s, the practice continued in some parts of Africa and Asia.

Sleep

Many animals, including humans, sleep. When people sleep, their eyes are closed, their muscles are relaxed, and they are usually lying down. Getting enough sleep is an important part of being healthy.

Did You Know?

Most dreams occur during a part of sleep when there are rapid eye movements (REMs). People usually have three to five periods of REM sleep per night.

Scientists are not sure exactly why people and other animals sleep. Some scientists think that sleep is a way for animals to save energy, because the body uses less energy when asleep than when awake. Other scientists think that sleep allows the body and mind to rest and recover from the day's activities. People who do not get enough sleep may have difficulty remembering and concentrating.

People need different amounts of sleep at different times in their lives. A new baby may sleep for as many as 16 hours a day by taking frequent naps. A 2-year-old child usually naps during the day and sleeps for a longer period through the night. As children grow into adults, they usually stop taking regular naps and sleep for a single, long period each night. The average amount of sleep for an adult ranges from six to nine hours each night. Elderly people may nap often during the day and sleep only a few hours at night.

Sloth

Sloths are slow-moving mammals that spend most of their lives in trees. They cling to the trunks or hang upside down from the branches. Sloths live in the tropical forests of Central and South America. They are related to armadillos and anteaters.

Sloths can grow up to 27 inches (69 centimeters) long. They have thick skin and either a short, stumpy tail or no tail at all. The fur is usually grayish brown or tan. Sloths often have a greenish tint

A three-toed sloth clings to a tree trunk.

because of algae on their fur. The algae protects sloths from other animals by helping them to blend in with tree leaves.

Sloths have either two or three toes on their feet. The toes have long, curved claws, which the sloth uses to grasp branches. Two-toed sloths spend much of the time hanging onto trees with all four legs. Three-toed sloths often sit on the branches rather than hang from them.

Sloths are quiet animals that live alone. They sleep most of the day. Sloths sleep hanging upside down, with the head tucked up between the front legs. At night they move very slowly through the trees eating leaves and fruit. Sloths rarely come down from the trees because they cannot walk.

Slovakia

Slovakia is a small country in central Europe. From 1918 to 1992 Slovakia was part of the country of Czechoslovakia. Slovakia's capital is Bratislava.

Slovakia shares borders with the Czech Republic, Poland, Ukraine, Hungary, and Austria. The Carpathian Mountains run across northern Slovakia. Lower mountains rise in the center. Slovakia has cool summers and cold winters.

Forests cover nearly half of Slovakia. Alpine grass and shrubs grow in the highest areas. Bears, wolves, lynx, wildcats, otters, and mink live in the mountains. Slovakia's many birds include wild geese and herons.

Slovaks make up most of the population. The rest of the people are mainly Hungarians. Slovak is the main language. Roman Catholicism is the most common religion.

The oldest parts of Orava Castle in Slovakia are more than 700 years old.

Banking, tourism, and other services are large parts of Slovakia's economy. Manufacturing and mining are also important. Factories produce metals, machinery, flour, fuels, paper, and other goods. Mines provide iron and coal. The main crops grown in Slovakia are wheat, sugar beets, and corn.

Tribes of people called Slavs settled Slovakia's land in the 500s or 600s. Hungary later conquered the region. In 1526 the Hapsburg Empire of Austria took over Hungary and Slovakia. After 1867 Slovakia was a part of the Austro-Hungarian Empire. In 1918 Slovakia joined a new country called Czechoslovakia.

In 1989 the people of Slovakia voted to separate from Czechoslovakia. Slovakia became an independent country on January 1, 1993. In 2004 Slovakia joined the European Union.

Slovenia

Slovenia is a country in the Balkans, a region of southeastern Europe. The capital is Ljubljana.

Slovenia shares borders with Italy, Austria, Hungary, and Croatia. In the southwest Slovenia has a short coastline on the Adriatic Sea.

Parts of the Alps mountains stretch across northern Slovenia. The Sava and Drava rivers flow down through the east. In the southwest is the Karst, a rocky region with many caves. Most of Slovenia has cool or warm summers and cold winters.

Slovenia's many forests include juniper, birch, and beech trees in the hilly areas. Shrubs grow in the lower areas. Brown bears, wolves, lynx, wild boars, and deer live in Slovenia.

Most of Slovenia's people are Slovenes. Their language is also called Slovene.

A town sits in a valley near the Alps mountains in northern Slovenia.

Most of the Slovenes are Roman Catholics. Small groups of Serbs, Croats, Bosniacs (Muslims), and others also live in Slovenia.

Manufacturing is important to the economy. Slovenia produces iron and steel, electronics, cloth, chemicals, wood products, and motor vehicles. Banking and other services are also important.

Slavic people, the ancestors of the Slovenes, settled in the region in the 500s. Over the centuries different powers ruled the Slovenes. In 1918 Slovenia joined the new Kingdom of Serbs, Croats, and Slovenes. The country was renamed Yugoslavia in 1929. Slovenia broke away from Yugoslavia in 1991. In 2004 Slovenia joined the European Union.

Smallpox

Smallpox is a dangerous disease caused by a tiny germ called a virus. Smallpox once killed or scarred many people. However, in the late 20th century scientists fought the disease successfully. There have been no naturally occurring cases of smallpox since the 1970s.

People who have the smallpox virus can spread it to other people through their breath or saliva. The virus also can live on bedding or clothing. Once a person is infected by the smallpox virus, there is no cure for the disease.

People with smallpox get a high fever. They also get body aches and become very tired. A rash appears on the skin. The rash changes into blisters. People can die from smallpox. People who survive may suffer permanent damage such as scars or blindness.

Smallpox existed for thousands of years in Europe, Asia, and Africa. Explorers brought the disease to the Americas after 1492. Many Native Americans died from it. Large outbreaks of smallpox happened around the world.

In 1796 an English doctor named Edward Jenner discovered a smallpox vaccine. A vaccine is a substance that prevents people from getting a disease. In 1967 a group called the World Health Organization began giving the smallpox vaccine to people around the world. The project was a success. By

A doctor gives a girl a shot of a vaccine in the 1960s to protect her against smallpox. Doctors vaccinated so many people that today the chances of catching the disease are very small.

1979 there were no cases of smallpox anywhere in the world.

Snail and Slug

Snails and slugs are similar animals. The main difference between them is that a snail has a shell and a slug does not. Snails and slugs belong to the group of soft-bodied animals called mollusks, which also includes oysters, clams, and squid.

Snails and slugs are found throughout the world. Some live on land or in trees. Others live in water. Some snails and slugs spend the winter underground.

Most snails and slugs are small and drab. A snail has a coiled body and shell. The shell protects the snail from heat and enemies. Snails can make their shells

A snail glides along the surface of a leaf.

bigger as they grow. Slugs have straight bodies. Both snails and slugs have two long tentacles sticking out from the head. Each tentacle has an eye at the tip.

Snails and slugs move by gliding on a foot. They make a slimy fluid that helps the foot glide.

Snails and slugs eat plants. Slugs also eat dead animal material and sometimes worms and snails. Snails and slugs are eaten by snakes, toads, turtles, beetles, and birds.

Gardeners consider snails and slugs to be pests. But people eat some types of land snails, especially in France.

Snake

A snake is a reptile with a long, slender body but no arms or legs. Snakes are closely related to lizards. There are about 2,900 species, or kinds, of snake. The

best-known snakes include cobras, vipers, boas, and pythons.

Where Snakes Live

Snakes are found throughout the world except near the North and South poles. The tropics have the greatest variety. Most snakes live on the ground, but others prefer trees. Some snakes spend their whole lives in underground tunnels. Sea snakes live in water.

Physical Features

Snakes are vertebrates, or animals with a backbone. The backbone is long and flexible. Snakes grow throughout their lives. The longest known snake is the reticulated python, which can grow to 32 feet (10 meters). The giant anaconda is usually not as long but is much heavier. The smallest snakes are the blind snakes. Some of them are barely 4 inches (10 centimeters) long.

Snakes are covered with rows of scales. Scales are hardened folds in the outer layer of skin. A scale can be shiny and smooth, or it can have a ridge running down the middle. A snake molts, or sheds its skin, many times during its life.

Snakes have no ears or eyelids. Clear scales cover the eyes. A snake's mouth opens wide because the lower and upper jaw can separate. Most snakes have long, needle-sharp teeth that curve backward. Some snakes, including cobras and rattlesnakes, have a long front or back pair of teeth called fangs. A snake's tongue is forked.

Snakes come in many different sizes and colors.

Behavior

Snakes eat mice, rats, birds, frogs, fish, insects, lizards, eggs, and sometimes other snakes. Most snakes swallow their prey whole, usually head first. The prey may be dead or alive when eaten. Boas, pythons, king snakes, and rat snakes are called constrictors. They coil around their prey and constrict, or squeeze, the animal to death before eating it. Vipers and cobras kill their prey by shooting venom, or poison, into it through their fangs.

Without ears, snakes cannot hear most sounds. But they can sense when prey is near through vibrations in the ground. Snakes can see very well, too. Snakes flick out their tongue to “taste” the air, which gives them information about their surroundings. Snakes do not have vocal cords. This means that they are voiceless. However, they can make a hissing sound by sending air through an opening in the mouth.

A black-and-yellow mangrove snake sticks out its forked tongue. A snake uses its tongue to gather information about its surroundings.

A snake's color can help protect it from enemies. Some snakes blend in with their surroundings. For example, many tree snakes are bright green and resemble vines. The bright colors of some snakes warn attackers that they are poisonous.

Snakes are cold-blooded animals. This means that their body temperature changes along with the temperature of their surroundings. To survive cold seasons, some snakes go into hiding places and become inactive for months at a time. This is like hibernation in mammals.

Movement

Most snakes move by pushing the scales on the underside of their body against the ground. The body moves in a series of S-shaped loops. Some large snakes, such as the boas, move in a straight line. They inch their body forward like a caterpillar does. Other snakes move by folding and unfolding like an accordion. Many desert snakes use a movement called sidewinding. They throw their body upward and sideways across the sand.

Life Cycle

Most snakes live alone for most of the year. Some kinds gather for mating or hibernation. Most snakes lay eggs, but others give birth to live young. The number of young varies from about 3 to more than 50. At birth, baby snakes look like adult snakes. Snakes kept by people can live more than 30 years. Snakes in the wild do not live as long.

A green mamba hatches from its egg. Baby snakes look like small adult snakes.

Snakes and Humans

Some people think snakes are scary and dangerous. However, a snake bites a human only when it is frightened or threatened. Plus, snakes eat rats and mice, which most people consider to be pests. People hunt snakes as a source of clothing and food. Some snakes are captured and sold as pets.

Snow

Tiny crystals of ice that fall to Earth are called snow. A crystal is a solid substance that has flat surfaces and sharp corners. Snowfall is made up of both single ice crystals and clumps of ice crystals. The clumps are called snowflakes.

How Snow Forms

Snow is formed high in the clouds from water vapor, which is water in the form of gas. If a cloud is cold enough, the water vapor freezes to form ice crystals. At temperatures between about -40°F (-40°C) and 32°F (0°C), water vapor crystallizes around bits of dust in the cloud. At lower temperatures, water vapor freezes directly into ice crystals.

The ice crystals can stay up in the clouds. Or, if they are heavy enough, they can fall to the ground. As they fall they can clump together with other ice crystals to form snowflakes. One snowflake can contain as many as 100 ice crystals. But some single ice crystals fall as snow, too.

Snowflake Shapes

The way that ice crystals join together gives every snowflake a unique design. Even so, most snowflakes have six points or six sides. They form seven basic shapes: stars, needles, dendrites (having branches), plates, columns,

A layer of snow covers the ground in a mountainous region. Like rain, snow is made of water. But the water in snow is frozen into crystals of ice.

columns capped with plates, and irregular (damaged). What shape a snowflake takes depends on the temperature and the amount of moisture in the cloud.

Where Snow Falls

Snow falls in many places that get cold weather, mainly during winter. In areas near the North and South poles, snow covers Earth year-round. Near the equator, snow falls only in the highest mountain regions.

Effects of Snow

Snow greatly affects climates and living things. A cover of snow on the ground helps to keep the air cold. This happens because snow reflects, or bounces back, most of the sun's heat. However, a snow cover can also protect small plants from the effects of severe cold. When snow melts in the spring, it provides freshwater for people and animals. But if snow

does not melt for years, it may form huge slabs of ice, called glaciers.

Soccer

Soccer is the world's most popular team sport. In most parts of the world the game is called football or association football. Both men and women play soccer in schools, clubs, and on national and professional teams. In a soccer game two teams compete to score more points, which are called goals. The players move the ball around a rectangular field, usually by kicking it. A team scores when it sends the ball into the opposing team's goal.

The World Cup soccer tournament is the world's most popular sports event. Every four years teams from many countries compete for the World Cup.

Playing Area and Equipment

Soccer fields vary in size. A field should be 100 to 130 yards (90 to 120 meters) long and 50 to 100 yards (45 to 90 meters) wide. Boundary lines called touchlines mark the sides of the field. Goal lines mark the ends of the field. A goal is located at each end of the field. The goal is a frame that is 8 yards (7.3 meters) wide and 8 feet (2.4 meters) high. It has a net on the top, sides, and back. A soccer ball is round and filled with air.

Snow piles up against a window in Norway. The crystal structure of snow can be seen in the small clumps of flakes.

Soccer fields can vary in overall length and width. But penalty areas, goal areas, and goals always are the same sizes.

Playing the Game

Soccer teams are made up of 11 players each. Each team tries to control the ball and move it toward the opponent's goal. Only one player on each team, the goalkeeper, can touch the ball with the hands and arms. The rest of the players can touch the ball with any part of the body except the hands and arms. They usually move the ball with their feet.

Roles of the Players

During a soccer game the players of each team spread across the field in loose formations. A formation generally has front, back, and middle sections.

The front section is the offensive, or scoring, part of the team. The main offensive players are called forwards, or strikers. When a team has the ball, the forwards try to score goals. A team's forwards are usually located closest to the opponent's goal.

The back section is mostly defensive—it protects the team's goal. Each team has a goalkeeper in front of its goal. Goalkeepers try to deflect or catch the opponent's shots at the goal. Players called

defenders form a defensive screen between their goalkeeper and the opposing team. Defenders try to take the ball from the other team.

The players in the middle section play both offense and defense. Midfielders generally are located between their team's forwards and defenders.

Playing Skills

Soccer players move the ball by either dribbling, kicking, or heading it. A player dribbles by using very short kicks to move the ball forward. Dribbling allows a player to keep control of the ball while running down the field. Players use longer kicks to pass the ball to teammates or to try to make a goal. Striking the ball with the head is called heading. Players often head the ball when receiving long, high passes. Sometimes they also try to head the ball into the goal.

When one player has the ball, players on the opposing team try to take the ball away from that player. This is called tackling. In one type of tackle a player uses the feet to kick or steal the ball

away from an opponent. Another way to get the ball is to intercept a pass. A player intercepts a pass by stealing the ball during a pass between two opponents.

Fouls

Three officials—a referee and two assistants—control the game. They give teams penalties when players commit fouls, or break the rules. After some fouls the officials award free kicks to the other team. When a free kick is taken, all players of the offending team must be at least 10 yards (9 meters) from the ball. The officials award penalty kicks for more serious fouls. A penalty kick is a free kick at the offending team's goal. It is taken from a spot 12 yards (11 meters) from the goal. All players other than the defending goalkeeper and the kicker must stand aside.

History

Games like soccer were played in China more than 2,000 years ago. Similar games were also played in ancient Greece, Rome, Japan, and Mexico. But

Portugal's goalkeeper fails to stop France from scoring a goal on a penalty kick during the 2006 World Cup.

Mia Hamm of the United States drives to the goal in a game against Brazil in 1999. Later that year Hamm led the U.S. team to a women's World Cup championship.

the modern game of soccer started in England. In 1863 several English soccer teams formed the Football Association (FA). It created the first standard set of rules for the game.

The FA was an amateur organization, which means that its players were not paid. Professional soccer leagues, in which players were paid, began in the late 1880s. They formed first in England and then in other countries. By 1900 people were playing soccer throughout the world.

In 1904 the Fédération Internationale de Football Association (FIFA) was formed. FIFA governs the game at the international level. In 1930 FIFA organized the first World Cup tournament.

The first women's World Cup was held in 1991.

Soccer became an official event at the Olympic Games in 1908. It was the first team sport to be included in the Olympics. Women's soccer became an Olympic event in 1996.

Soccer is not as popular in the United States as it is in other parts of the world. In the 1990s, however, it began to grow in popularity. In 1994 the United States hosted the World Cup. Two years later a professional league—Major League Soccer—was formed. The United States also hosted the Women's World Cup in 1999, and the U.S. team won that championship. In addition, many young people in the United States enjoy playing the game.

Socialism

Socialism is a way to organize a society. It deals mostly with the economy, or the part of a society that creates wealth. The goal of socialism is to spread wealth more evenly and to treat all people fairly. People have had different ideas about how to create a socialist society. But most have agreed that the government, not individuals, should control at least some businesses and property.

Beginnings of Socialism

Socialism began as a reaction to the system called capitalism. In capitalism, individuals own property, and people and companies compete with one another for wealth. Capitalism grew

strong during the Industrial Revolution. This was a time in the 1700s and 1800s when many machines were invented and factories were built. The owners of the factories grew wealthy. But the workers worked very hard for little money. Plus, they were often mistreated.

To create a fairer society, some people wanted the government to control industry. The government could then use its economic power to create a comfortable life for everyone. This new system was socialism. Socialists believed that the ownership of factories and other property would gradually pass from a few wealthy people to the workers.

Some socialists did not want to wait for gradual change. Instead, they wanted workers to overthrow the capitalist system. A German scholar named Karl Marx believed that workers eventually

In 1910 Charles Edward Russell, an American journalist and writer, ran for the governor of New York as a socialist.

would create an extreme socialist system known as Communism. In a true Communist society, there would be no private property or government. People would produce and share goods and other wealth based on their different abilities and needs.

Socialist Governments

The Russians set up the first Communist government. They formed a new country, called the Soviet Union, in 1922. In the 1940s many countries of eastern Europe also became Communist. After World War II (1939–45) Communists took control of China, North Korea, Vietnam, and Cuba. Many African countries also turned to Communism.

After the war Great Britain, France, Italy, and Germany adopted some socialist ideas, too. Their governments took control of some businesses. They also set up programs to provide money, health care, and other services to citizens who

needed them. Even some countries that rejected socialism—such as the United States—set up social service programs.

End of Extreme Socialism

By the end of the 1900s extreme socialism had failed to live up to its promise. Communist countries tended to have harsh governments. Their citizens were also much poorer than those in capitalist countries. The Communist governments in the Soviet Union and eastern Europe collapsed in the 1990s. China remained Communist but began to allow private business ownership.

Some governments in Europe, Latin America, and elsewhere continued to follow socialist ideas. However, they also supported capitalism.

Social Science

The social sciences are fields of study about human life and behavior. The social sciences are also known as social studies or behavioral sciences. People who study social sciences look at how people think and act. They also study how people form groups and relate to other people.

The main social sciences are anthropology, economics, political science, psychology, and sociology. Anthropology is the study of humans and their cultures throughout history. Economics is the study of how people make wealth and spread it around. Political science is the

A membership card from the socialist organization called the International Working Men's Association shows the signature of Karl Marx, who was active in the group.

Social scientists study many types of groups of people, including the family.

study of governments. Psychology is the study of the human mind and human behavior. Sociology is the study of society, or the different groups that people form.

Some people consider other subjects to be social sciences, too. These subjects include communications, education, geography, history, and law.

Sociology

Sociology is the scientific study of human societies, or groups. Scientists in

this field are called sociologists. Sociology is one of the social sciences. The social sciences deal with human life and behavior. They also include psychology and anthropology.

Humans are naturally social beings. This means that they form groups and enjoy relating to others. But the rules and pressures of groups deeply influence people. A group can cause people to act differently than they might act outside the group.

Sociologists study the influence of groups on human behavior. They study how humans behave in small groups, such as families and schools. They study how humans behave in larger societies, such as cities and countries. Sociologists also examine how societies develop and change.

The work of sociologists helps to explain the causes of poverty, crime, and other problems in society. This information is helpful to lawmakers, business leaders,

Bulgaria

Softball

Softball is a sport that has rules similar to those of baseball. However, softball has a smaller field and a larger, softer ball. Also, a softball pitcher throws the ball with an underhand motion. Both men and women play softball.

Playing Area and Equipment

A softball field is shaped like a triangle with one rounded side. This is the same shape as a baseball field. The field is divided into an infield and an outfield. Four bases lie inside the infield. The

bases are called home plate, first base, second base, and third base. They mark the corners of a square area called the diamond. The sides of the diamond are about 60 feet (18.3 meters) long. A pitcher's mound rises in the middle of the diamond. The outfield lies beyond the infield.

A softball is about 12 inches (30.5 centimeters) around. The players wear webbed gloves to catch the ball. To hit the ball, they use a rounded bat.

Playing the Game

A softball team has nine or 10 players. During a game two teams take turns fielding, or playing defense, and batting, or playing offense. The fielding team's pitcher stands on the mound. The catcher plays behind home plate to catch the ball. One player plays at each base, and the others cover the rest of the field.

Playing softball is a popular way to get exercise and have fun.

The batting team tries to score runs, or points, against the fielding team. It sends batters, one at a time, to home plate. Batters try to hit the ball, which the pitcher throws toward home plate. If the batter swings at the ball and misses, it is called a strike. If the batter does not swing, the pitch is called either a strike or a ball, depending on whether it was good or bad. Three strikes make an out, or the end of the batter's turn. Four balls make a walk, which means the batter goes to first base. If the batter hits the ball into the field, he or she begins to run around the bases.

After the batter hits the ball, the players in the field try to get the batter out. They can do this by catching the ball, touching the batter with the ball, or getting the ball to first base before the batter gets there. If the batter reaches a base without any of these things happening, the batter is safe. This player may then move to the next base when the next batter hits the ball. When a player on the batting team has touched all four bases, he or she scores a run.

The batting team keeps batting until there are three outs. After both teams have a turn batting, an inning is finished. Seven innings make up a game. At the end of the game, the team with more runs wins. The teams may play extra innings to break a tie score.

History

Many people think that softball was invented in Chicago, Illinois, in 1887. Men's and women's teams soon formed

Did You Know?

In its early days softball was known as kitten ball, mush ball, diamond ball, indoor-outdoor, and playground ball.

A player pitches the ball during a women's softball game at the Summer Olympics. Unlike in baseball, softball pitchers throw the ball with an underhand motion.

elsewhere in the United States and in Canada. The Amateur Softball Association of America (ASA) was formed in 1933. The ASA still oversees softball in the United States. The first International Softball World Championships were held in 1965. In 1976 the International Women's Professional Softball League was formed. In 1996 women's softball was added to the Summer Olympics.

Soil

Soil is a mixture of minerals and organic material that covers much of Earth's surface. Minerals are bits of rock, and organic material is the remains of living things that have died. Soil is not as solid

as rock. It has many small spaces, called pores, that hold water and air. In some places on Earth, a thin layer of soil only 6 inches (15 centimeters) thick lies on top of rock. In other places, though, soil may be hundreds of feet deep.

The Importance of Soil

Without soil, most life on Earth could not survive. Soil provides a place for plants to grow. It holds water in place for their roots. It contains nutrients, or food substances, needed for their growth. Soil also provides a home for many animals and other living things.

Soil forms slowly. A layer of soil that is 1 inch (2.5 centimeters) thick may take 500 to 1,000 years to form. For this reason it is important to protect soil from erosion—being blown or washed away.

How Soil Forms

The mineral part of soil forms from rocks. Such forces as wind, water, and

Dark layers of soil lie near the ground's surface in the U.S. state of Montana. Beneath them is glacial till—a mixture of clay, sand, and rocks that a glacier left behind when it melted away.

temperature changes break rocks down into tiny particles, or bits. The smallest particles are called clay. Medium-sized particles are called silt. The largest particles are called sand. Different types of soil contain different mixtures of clay, silt, and sand.

The organic part of soil forms when plants and animals die. Their bodies decay, or break down, and mix with the rock particles. The organic material, called humus, helps to form the pores in the soil. It keeps the soil soft and loose. Humus also provides the nutrients used by plants.

Layers of Soil

Soil is made up of layers. The layers rest on solid rock, called bedrock. A layer of broken rock rests on the bedrock. Some of this rock may have gone into forming the soil above. The soil above the broken rock is called subsoil. Subsoil contains mostly minerals and a small amount of humus. Only the deepest plant roots reach the subsoil. The top layer is called topsoil. Topsoil contains a lot of humus. It is the layer where plants grow.

Solar Energy

Solar energy is light, heat, and other forms of energy given off by the sun. Solar energy can be collected and used to heat buildings and to make electricity.

The roof of a house has flat-plate collectors that capture solar energy to heat air or water.

Solar Heating

Most solar heating systems capture solar energy with a device called a flat-plate collector. The collector is a large plate of black metal covered with a sheet of glass. It is usually placed on the roof of a building. The plate absorbs sunlight and uses it to heat air or water that flows through pipes behind it. The air or water then goes through the building's heating or plumbing system. It can also be held in a storage tank for later use.

Making Electricity

Devices called solar furnaces and solar cells can turn solar energy into electricity. A solar furnace uses the sun's heat to make electricity. It has mirrors that focus large amounts of solar energy into a small area. A solar furnace can produce temperatures of up to 3,630° F (2,000° C). This heat can be used to make steam. The steam can be used to make electricity in a power plant.

Solar cells use the sun's light rather than its heat. When the sun shines on a solar

cell, the cell turns the light energy into electricity. A single solar cell makes only a little electricity. However, groups of solar cells can provide electricity for whole buildings. Solar cells are also used in a variety of products, including calculators, watches, electronic toys, and portable radios.

Benefits and Costs

Solar energy has two big benefits over fossil fuels (coal, oil, and natural gas). First, though fossil fuels can be used up, there is an endless supply of sunlight. Second, solar energy does not cause pollution, like burning fossil fuels does. However, the equipment needed for

collecting and using solar energy is expensive. The high cost of solar energy has limited its use.

Solar System

The solar system consists of the sun and everything that orbits, or travels around, the sun. This includes the eight planets and their moons, dwarf planets, and countless comets, asteroids, and other small, icy objects. However, even with all of these things, most of the solar system is empty space.

Solar System

The distance between each object and the sun is shown in astronomical units (AU). One AU equals the average distance from Earth to the sun. It is about 93 million miles (150 million kilometers).

inner planets are shown in scale to each other

The solar system consists of the planets that orbit the sun as well as smaller bodies such as dwarf planets, comets, and asteroids.

The solar system itself is only a small part of a huge system of stars and other objects called the Milky Way galaxy. The Milky Way galaxy is just one of billions of galaxies that in turn make up the universe.

The Sun

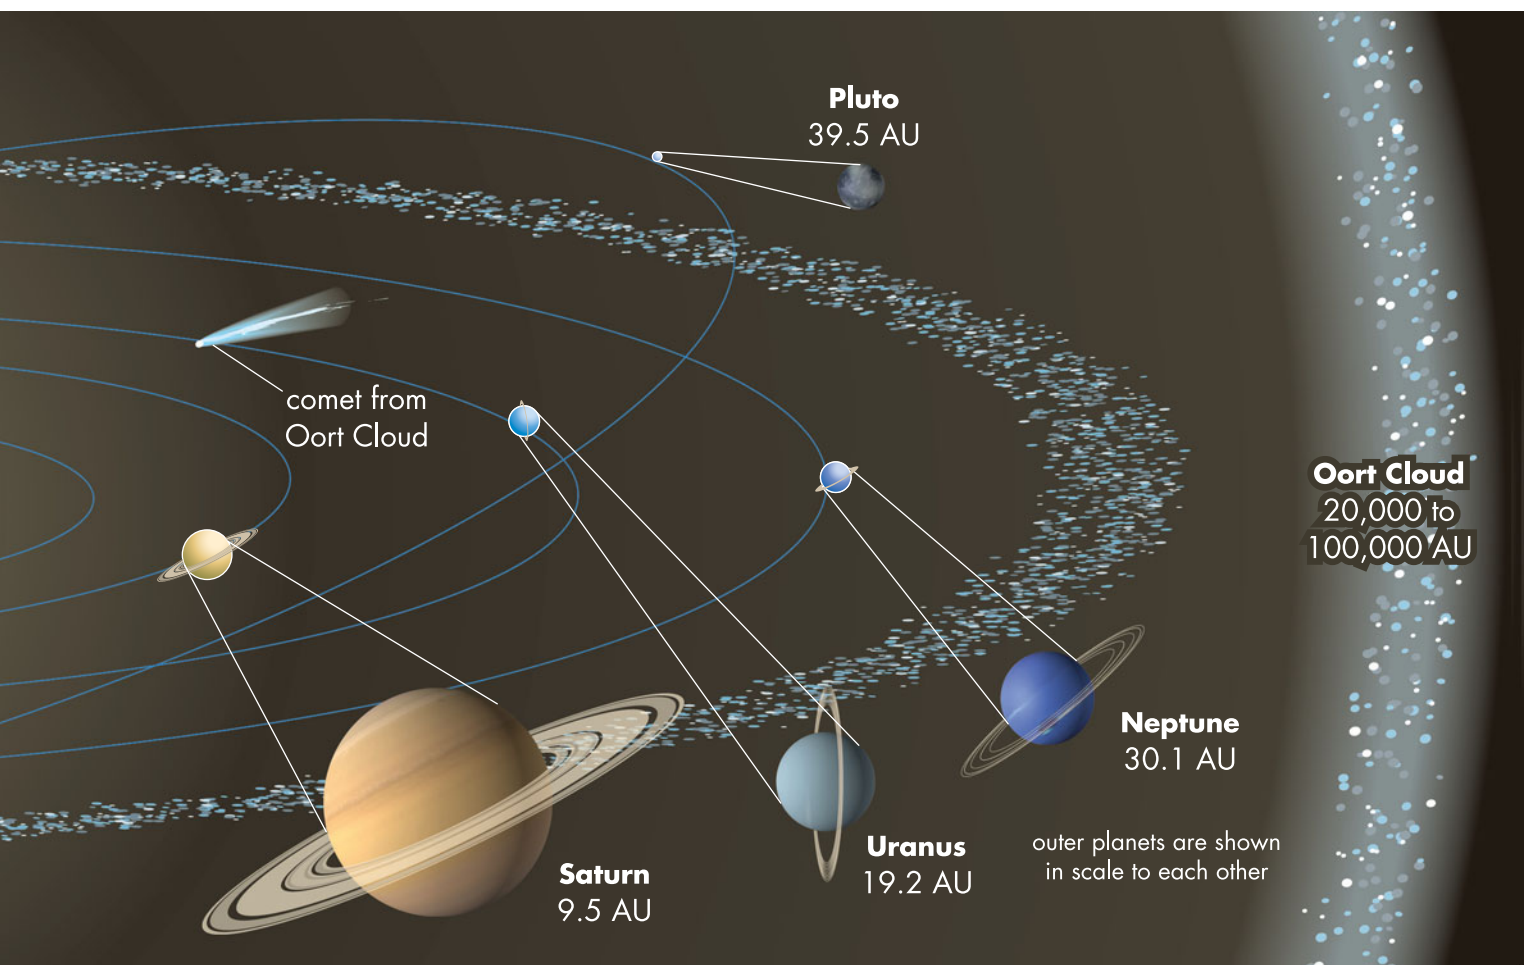

At the center of the solar system is a star called the sun. It is the largest object in the solar system. The sun is a very hot ball of hydrogen and helium gases. It constantly changes the hydrogen in its core into helium. This process gives out huge amounts of energy. Living things on Earth depend on light and heat from the sun.

The Solar Wind

The gases that surround the sun shoot out a stream of tiny particles called the solar wind. It flows outward through the whole solar system. The solar wind is what causes auroras, or displays of colored light in the night sky in parts of Earth.

The Planets

After the sun, the largest objects in the solar system are the planets. In order from closest to the sun, these planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Most of them orbit the sun in paths shaped like

The Oort Cloud is part of the solar system. It consists of countless small, icy objects. Many comets were once part of the Oort Cloud.

Some Facts About the Planets				
Name	Date Discovered	Diameter (approximate)	Period of Rotation (Length of Day) in Earth Days	Period of Orbit Around Sun (Length of Year) in Earth Years
Mercury	ancient times	3,000 mi (4,900 km)	58.6	0.24
Venus	ancient times	7,500 mi (12,100 km)	243	0.62
Earth		7,940 mi (12,780 km)	0.997	1
Mars	ancient times	4,200 mi (6,800 km)	1.03	1.88
Jupiter	ancient times	89,000 mi (143,000 km)	0.41	11.86
Saturn	ancient times	74,900 mi (120,600 km)	0.44	29.4
Uranus	1781	32,000 mi (51,000 km)	0.72	84
Neptune	1846	31,000 mi (50,000 km)	0.67	164

circles. Most of the planets have at least one moon. Scientists used to call Pluto the ninth planet. But in 2006 scientists decided to call Pluto a dwarf planet instead.

Asteroids

Millions of small chunks of metal and rock called asteroids also orbit the sun. Most asteroids are found in a ring between Mars and Jupiter. Small asteroids regularly fall to Earth or burn up in the sky as glowing meteors.

Comets

Comets are small chunks of dirt and ice. Billions of them orbit the sun in very long paths shaped like ovals. Most comets are too small or too distant to ever be seen from Earth. Comets come from two parts of the outer solar system: the Kuiper Belt and the Oort Cloud.

Outer Regions

Beyond Neptune lies the Kuiper Belt, a flat ring of millions of small, icy objects. These objects orbit the sun at a very great distance. They are mostly 30

to 50 times farther from the sun than Earth is.

At the outer reaches of the solar system is the Oort Cloud. It is a huge cloud of countless small, icy objects. The Oort Cloud surrounds the rest of the solar system.

How the Solar System Was Formed

The solar system formed about 4.7 billion years ago. It probably started as a loose cloud of gas and dust. Scientists think that a force called gravity pulled parts of the cloud together into clumps. The largest clump was squeezed together so tightly that it got very hot. This clump eventually became the sun. Over millions of years the other clumps became the planets. The sun’s strong gravity eventually pulled the planets into their orbits. Over time some of the left-over clumps became asteroids, comets, and other small, icy objects.

Solomon Islands

The Solomon Islands is a country in the southwestern Pacific Ocean. The capital, Honiara, is on the country's largest island, Guadalcanal.

The islands lie east of Papua New Guinea, in the region called Oceania. The country includes eight main islands and hundreds of small islands. The main islands have many mountains and volcanoes. Many of the small islands are made of coral. The country's climate is hot, humid, and rainy.

Thick rain forests cover most of the land. Mangroves and coconut trees grow along the coasts. Many flowering plants, including orchids, also grow on the islands. The country has a wide variety of birds, butterflies, fish, and reptiles.

Most of the country's people are Melanesians, or people native to the southwestern Pacific islands. There are many local languages. The different groups communicate using Pijin, a lan-

Coral reefs surround some of the small islands in the Solomon Islands group.

guage based on English. Most of the people live in small villages.

The economy is based on farming, logging, and fishing. Farmers grow coconuts, sweet potatoes, taro, yams, and fruits. They raise pigs, cattle, and chickens. The Solomon Islands produces palm oil and cocoa.

People have lived on the Solomon Islands for at least 4,000 years. Spanish explorers visited the islands in 1568. Great Britain gained control of the islands by 1899.

In 1978 the Solomon Islands became independent from Britain. Since independence, violence between different groups has been a serious problem.

Somalia

The country of Somalia in northeastern Africa is a hot and dry land. Many of the people follow a nomadic, or wandering, lifestyle. The capital is Mogadishu.

Geography

Somalia sits on the Horn of Africa, the most eastern part of the continent. The Gulf of Aden lies to the north, and the Indian Ocean lies to the east. On land, Somalia borders Djibouti, Ethiopia, and Kenya.

Plains and high, flat areas called plateaus make up most of the land. Mountains rise in the northeast. Sand dunes stretch along the east coast. The Jubba and Shabeelle rivers flow through the south. Between those rivers is the richest farmland in the country.

Somalia is one of the world's hottest countries. The southwest and the north-

Girls at a school in northeastern Somalia wear green veils to class.

west receive more rain than the northeast, which is very dry.

Plants and Animals

Grasses and scattered trees cover much of the land. About two thirds of the land is used as pasture, or feeding areas for livestock. Few plants grow in the dry northeast.

Somalia's wildlife includes lions, leopards, hyenas, foxes, warthogs, ostriches, and antelope. Hunting has greatly reduced the numbers of giraffes, zebras, antelope, hippopotamuses, rhinoceroses, and elephants.

People

More than half of Somalia's people are nomads, or people who move from place to place while raising livestock. Settled farmers live mainly in the south. Almost all the people are Somalis. The Somalis are divided into many clans, or groups of related families. Small groups of Ban-

tus and Arabs also live in the country. Nearly everyone is Muslim.

Somali and Arabic are the national languages. Some people also speak English or Italian. The Somali language did not have a written form until 1973.

Economy

Somalia is one of the poorest countries in the world. Its economy is based on livestock raising and farming. Sheep, goats, camels, and cattle are the main livestock. Farming is possible on only a tiny percentage of the land. The main crops include bananas, sugarcane, sorghum, corn, cassava, cotton, and sesame seeds. Somalia sells live animals, bananas, fish, animal hides, charcoal, and scrap metal to other countries.

Somalia is a very poor country. Most of the land is not good for growing crops. Many of the people live in small villages and raise livestock.

History

The coasts of Somalia were probably part of an ancient land called Punt. Between the 600s and 900s Arabs and Persians set up trading posts along the coasts. By the 900s Somali nomads had entered the area.

European Rule

Europeans explored the region in the 1800s. In 1884 the British took over a section in the north, which they called British Somaliland. Italy soon took over several regions in the northeast and along the southern coast. The land claimed by Italy was known as Italian Somaliland. In 1960 Italian Somaliland and British Somaliland gained independence. Together they formed the new country of Somalia.

Civil War

In 1969 the military took over Somalia's government. In January 1991 rebels overthrew the military government. The country then split into a number of regions, each controlled by a clan or a group of clans. In May 1991 the region that used to be British Somaliland declared independence as the Republic of Somaliland. Civil war broke out as the clans fought for territory. In 1998 the northeastern part of Somalia, known as Puntland, also set up a government of its own.

A new Somali government formed outside the country in 2004. However, fighting continued inside Somalia.

Songbird

Almost half the species, or types, of bird in the world are songbirds. The 4,000 species of songbird all belong to one huge scientific group. Many types sing beautiful and complex songs. However, not all songbirds sing much or have pleasant-sounding voices. What they have in common are highly developed vocal organs. Some well-known songbirds include canaries, cardinals, robins, blackbirds, bluebirds, nightingales, sparrows, finches, larks, swallows, and thrushes.

Birds of this large, varied group can be found nearly all over the world. They live on many different types of land.

Physical Features

Songbirds are typically about 5 to 8 inches (12.5 to 20 centimeters) in length, though some are larger or smaller. The structure of their feet allows them to perch on branches. On each foot, three toes point forward, and one toe points backward.

The grasshopper warbler is a songbird of Europe and Asia.

The syrinx, or song box, is the organ in a bird's chest that produces sound. A bird sings by sending air through its song box. Songbirds have very complex song boxes and several sets of tiny muscles to control them. Some songbirds make mostly short, simple calls, such as the "caw" of some crows. Other types also produce long songs that are musical and varied. Some songbirds, such as mockingbirds, even imitate the songs of other birds.

Behavior

Songbirds sing for a variety of reasons, especially during the breeding season. Their songs show that they are ready to mate. Songbirds may also make a variety of calls to communicate with their mates and young. Many songbirds sing to announce that a certain territory is theirs. They sing at different spots along the edges of their land to try to prevent other birds from taking over it. In many species only the male sings complicated songs.

Different types of songbird eat different foods, including insects, fruits, and seeds. Many types are known for building complex nests.

Songhai Empire

The Songhai Empire controlled trade in much of western Africa during the 1400s and 1500s. The empire was cen-

tered in what is now central Mali. It eventually extended west to the Atlantic coast and east into what are now Niger and Nigeria. Songhai grew rich trading gold and salt up and down the Niger River and across the desert lands of the Sahara.

Songhai people had settled in the city of Gao in about AD 800. The Mali Empire took over Gao in 1325. After 50 years the Songhai won back their independence. A great Songhai warrior named Sonni 'Ali took power in 1464. He built the Songhai Empire by conquering Timbuktu, Jenne, and other nearby cities.

Most Songhai people raised herds of animals for a living. However, many Songhai lived in big cities. All the cities were centers of trade on the Niger River. Gao was the capital. It had about 100,000 people. Timbuktu had at least 80,000 people. It was the site of a famous university. While most of Song-

hai's herders continued to follow traditional religions, Islam became the religion of the cities.

The empire prospered until the late 1500s. Then an army from Morocco, a kingdom on Africa's northwestern coast, swept down over the Sahara. By 1591 the Moroccans had easily captured the cities because they had better weapons than the Songhai had. The people outside the cities continued to fight the Moroccans, but they could not bring back the empire.

Sorghum

Hundreds of seeds are bunched together on a sorghum plant.

Sorghum plants belong to the grass family, as do corn and other grains. Sorghum is one of the major grains grown in Africa. Farmers also grow sorghum in

Did You Know?

Sorghum grows better in hot and dry conditions than most other grains.

the Americas, Asia, southern Europe, and Australia.

Sorghum plants often grow to a height of 2 to 8 feet (0.5 to 2.5 meters). Some may grow to be 15 feet (4.5 meters) tall. Clusters of flowers grow at the top of each sorghum plant. The clusters produce 800 to 3,000 seeds.

Farmers grow and harvest sorghum for these starchy seeds. The seeds are a cereal grain like wheat, rye, oats, and rice. People grind them to make cakes, breads, and porridge, which is a dish similar to oatmeal. People also use sorghum plants to feed animals, to make hay, and to make brooms and brushes.

In some types of sorghum the stems contain sweet juices. In the southern United States and in southern Africa farmers grind sorghum stems to collect the juices. They then boil the juices to make a thick, sweet syrup, also called sorghum.

Sound

A sound is anything that can be heard. Music, the barking of a dog, the wailing

of a siren, and the voice of a friend are all sounds.

What Makes Sound

For a sound to be made and heard, three things need to happen. First, an object vibrates. A vibrating object makes tiny, very fast back-and-forth movements. For example, when a musician strums guitar strings, they vibrate. The vibration moves the surrounding air and produces waves of sound.

Second, the sound waves pass into a medium. A medium is any substance through which the waves can travel. Sound waves may travel through many mediums. These include air, water, and solid objects. Sound waves pass through mediums in all directions.

Third, some kind of receiver, such as the ear of a person, picks up the sound waves. The ear changes the sound waves into signals that travel to the brain. The brain understands these signals as sound.

Speed of Sound

The speed of sound varies depending on what medium it is traveling through. In air at a temperature of 70° F (21° C) sound travels at a speed of 1,129 feet (344 meters) per second. This means

Sound waves travel through air from a source to a receiver.

Sound can damage a person's hearing if it is too loud. Construction workers and other people who cannot avoid loud sound should wear protective equipment over their ears.

that it takes sound about five seconds to travel one mile. In warmer air sound travels faster. Sound travels even faster through water and solid mediums such as iron and stone.

Pitch, Intensity, and Quality

Every sound has three basic properties: pitch, intensity, and quality. The pitch of a sound is how high or low it is. Faster vibrations cause sounds with a higher pitch. The intensity of sound is how loud or soft it is. Intensity depends on the strength of the vibrations. Stronger vibrations cause louder sounds. The quality, or timbre, of a sound is how harsh or pleasant a sound seems.

Loud sounds can damage a person's hearing over time. Loud sounds that have a high pitch can be especially damaging.

Ear

Sound Recording

Sound recording, or audio recording, is the storage of sounds so that they can be heard again. In professional and home recording studios, special equipment records the music that people listen to on compact discs (CDs) and their computers. Sound recording is also used in radio, television, and movies.

How Sound Recording Works

Sound is caused by tiny vibrations that travel through the air as waves. Sound-recording devices use a microphone to change the sound waves into electric signals that resemble the waves. A playback device turns the electric signals back into sound waves. It sends the

1877 Edison Phonograph

Thomas Edison's first phonograph recorded sound when someone spoke into the recording sound box while turning the hand crank. The recording sound box pressed a needle-like object called the recording stylus against the tinfoil cover of a rotating cylinder. A person could play the recording back by turning the crank while pressing another stylus against the same tinfoil. Then the reproducer sound box would reproduce the original sounds.

Two people can listen to a portable MP3 player if they share a set of earphones. A portable MP3 player is a digital audio player.

waves to loudspeakers to reproduce the original sound.

Recording devices can preserve sound in a number of formats. The earliest formats were phonograph records and magnetic tape. A phonograph record has a groove with patterns cut into it that represent the waves of sound. Magnetic tape represents sound with wavelike patterns of magnetized particles.

Most sound-recording devices today are digital devices. They store sound as a long series of numbers that describe the sound waves. On CDs this information is stored as a pattern of tiny pits, or holes, that are created and read by a laser beam. The digital information can also be stored in personal computers or in

portable devices called digital audio players.

History

In 1877 Thomas Edison, a U.S. inventor, made the first device for recording and playing back sound. It was a phonograph made up of a cardboard cylinder wrapped in tinfoil. It recorded sound with a small needle that formed a track in the tinfoil. Ten years later an inventor named Emil Berliner improved Edison's device by replacing the cylinder with a flat phonograph record. Berliner also invented a way to make copies of records. By the early 1900s records had become a popular form of home entertainment.

German engineers developed tape recorders in the 1930s and 1940s. U.S. and British researchers improved on the German equipment in the late 1940s. By the early 1980s music cassette tapes had become more popular than phonograph records.

Also in the early 1980s compact discs were introduced. Since then CDs have mostly replaced records and cassettes. At first people could only buy prerecorded CDs to play on a CD player. But in the 1990s recordable CDs were introduced. This technology allowed people to make their own CDs using a computer or a separate CD recorder. The first digital audio players appeared in the late 1990s.

South Africa

The country of South Africa covers the southern tip of Africa. It has three capital cities: Pretoria (Tshwane), Cape Town, and Bloemfontein.

Most of South Africa's people are black. However, white people controlled the government until 1994.

Geography

South Africa has a long coastline on the Atlantic and Indian oceans. To the north South Africa borders Namibia, Botswana, Zimbabwe, Mozambique, and Swaziland. South Africa also surrounds the tiny kingdom of Lesotho.

Most of South Africa is a plateau, or raised flat area. Mountains separate the high plateau from lower plains along the coast. The highest mountain range is the Drakensberg, in the east. The Kalahari and Namib deserts cover parts of the west. The main rivers in South Africa are the Orange and the Limpopo.

Most of South Africa has a dry climate with warm summers and cool winters. Drought is a common problem.

Plants and Animals

Grasslands with scattered trees cover much of South Africa. Many types of flowering plants grow in the southwest. The dry parts of the west have shrubs and bushes that can survive with little rain. South Africa's few forests grow in mountain valleys and along stretches of the coast.

South African schoolgirls enjoy themselves while on a field trip in the Western Cape Province, South Africa.

South Africa has limited numbers of lions, elephants, rhinoceroses, hippopotamuses, and antelope. The country's large animals live mainly in wildlife parks.

People

Black Africans make up about three fourths of South Africa's population. They belong to a number of groups, including the Zulu and the Xhosa. Each

A prince of the Zulu people of South Africa wears traditional clothing.

of the African groups has its own language.

Facts About SOUTH AFRICA

Population
(2008 estimate)
48,783,000

470,693 sq mi
(1,219,090 sq km)

Capitals
Pretoria (executive), Bloemfontein (judicial), Cape Town (legislative)

Form of government
Republic

Major cities
Cape Town, Durban, Johannesburg, Pretoria, Port Elizabeth

South Africa has three main minority groups: people of European descent, people of mixed ancestry, and people of Asian descent. The people of European descent speak either Afrikaans (a language related to Dutch) or English. The Afrikaners (those who speak Afrikaans) have mainly Dutch, French, and German roots. The English speakers have mainly British ancestors. The people of mixed descent have African, Asian, and European roots. The ancestors of the people of Asian descent came mainly from India.

Most South Africans are Christians. More than half of the people live in cities, mainly in the east.

Economy

Services such as banking and tourism are key parts of South Africa's economy. Mining and manufacturing are also very important. South Africa is a top producer of many minerals, including gold,

platinum, and chromium. It also mines coal and diamonds. Factories make iron and steel, food products, machinery, chemicals, cars, and other goods.

South Africa's major crops include corn, wheat, sugarcane, citrus fruits, and potatoes. Farmers also grow grapes to make wine. Meat, wool, and milk are other important farm products.

History

About 10,000 years ago the San and the Khoekhoe peoples roamed southern Africa. About 2,000 years ago peoples who spoke Bantu languages settled in the region. The Bantu peoples were the ancestors of most of the blacks in South Africa today.

European Settlement

The Portuguese sailed around the southern tip of Africa in the late 1400s. In 1652 the Dutch set up a colony on the southwest coast. They slowly expanded their settlements, planted crops, and raised livestock. They became known as Boers, meaning "farmers." (Later they became known as Afrikaners.) As the Boers moved east, they fought with many African peoples, especially the Xhosa.

By 1806 the British had taken over the Dutch settlement. To escape British rule, many Boers moved north during the 1830s and 1840s. Their move is known as the Great Trek. In the 1850s the Boers set up two states in the northeast: the South African Republic (or Transvaal) and the Orange Free State.

TIMELINE

The Dutch settle in South Africa.

1652

The British win the Boer War.

1902

The British take over the Dutch colony.

1806

The Union of South Africa is formed.

1910

The African National Congress is founded.

1912

Nelson Mandela is released from prison.

1990

South Africa elects its first black president; apartheid ends.

1994

British Rule

The British expanded their territory, called the Cape Colony, across the southern tip of Africa. They then tried to take over the Boer states. From 1899 to 1902 the British and the Boers fought the Boer War. After winning the war, the British made the Boer states into British colonies.

In 1910 all the British colonies in southern Africa united. They formed a new, independent country called the Union of South Africa.

Apartheid

Whites controlled the new government of South Africa. They passed laws that separated the population by race. This system of separation became known as apartheid. The word means “separateness” in the Afrikaans language. The system also gave the white minority nearly all the political power, most of the land, and the best jobs.

In 1912 blacks and people of mixed ancestry formed a political group that became known as the African National Congress (ANC). The ANC held non-violent protests against the white government. In 1960 police shot hundreds of protesters in Sharpeville, South Africa. In response, the ANC turned to bombings and other acts of violence to protest apartheid. Some ANC leaders, including Nelson Mandela, went to jail.

A New South Africa

In 1990 a new South African president, F.W. de Klerk, announced that apartheid would end. The government released Mandela from prison and threw out the apartheid laws. South Africans of all races voted in elections in 1994. Mandela became the country’s first black president.

South America

South America is the world's fourth largest continent. The countries of South America are also part of a larger cultural region known as Latin America, in which most of the people speak Spanish or Portuguese.

Land and Climate

Most of the continent is covered by rugged mountains and plateaus, which are high, flat lands. In the north are the Guiana Highlands. The Brazilian Highlands, another group of mountains and plateaus, covers more than half of Brazil. This amounts to about a quarter of South America. The Andes Mountains lie along the western edge of the continent. They are one of the most impressive ranges in the world. In eastern Peru and western Bolivia is a great plateau called the Altiplano. In the far south is a region of vast plateaus known as Patagonia.

Rugged mountains form a dramatic backdrop for the city of Ushuaia, in the province of Tierra del Fuego, Argentina.

South America has several rivers that form large basins. These basins are generally flat and low-lying. The largest is the Amazon basin. It includes parts of Brazil, Venezuela, Colombia, Ecuador, Peru, and Bolivia. The Paraná and Orinoco rivers also form basins.

The Amazon River is the most extensive river system in the world. Other major rivers include the Orinoco, Paraguay, Paraná, and Uruguay. Parts of the Andes have many lakes. In addition, vast marshes are found in many low-lying parts of the continent.

Most of South America has a tropical climate. In the tropical rain forests of the north and east, it is hot and rainy year-round. Parts of central South America have generally warm summers and cool winters, with plenty of rain. There are also several desert areas, including the coast of Peru and northwestern Argentina. In the far southern parts of Argentina and Chile and high in the mountains, it is mostly cold and rainy year-round.

Plants and Animals

The Amazon River basin contains the world's largest area of tropical rain forest. Many types of tree are found there. However, people are rapidly destroying large areas of rain forest. This is mainly because settlers are trying to use the land for agriculture or to build roads and houses. Savannas, which are grasslands with some trees, are typical in central

Misty spray rises from Iguazu Falls to create rainbows. The waterfalls are located on a stretch of the Iguazu River along the border between Brazil and Argentina.

Venezuela and Brazil. The coastal deserts of Chile and Peru have little vegetation.

Two of the better-known animals of the Andes are the llama and the alpaca. Other mammals include several cats (especially the jaguar and puma), deer, bears, wolves, foxes, and raccoons.

Mammals such as monkeys, porcupines, armadillos, anteaters, sloths, and a wide variety of rats, mice, and bats live in the rain forests. South America has more than a thousand kinds of bird. Hummingbirds, parrots, toucans, woodpeckers, and raptors can be found in different regions of the continent. The Andean condor is one of the largest flying birds. The Humboldt penguin is found in several spots along the coasts. There are also numerous types of fish and reptile, including many lizards and snakes.

People

Various groups of Native Americans, or American Indians, were the continent's original inhabitants. Today the population is a blend of several distinct groups: Native American, European (mostly Spanish and Portuguese), and African.

About 40 percent of the people in South America are white. Another 40 percent have mixed ancestry, either as mestizos (of white and Indian descent) or mulattoes (of black and white descent or black and Indian descent).

Most South Americans speak Spanish or Portuguese. Many Indian languages, such as Quechua and Aymara, are also spoken. In some areas people speak English, French, or Dutch. Most South Americans are Roman Catholic. In some countries people blend Catholicism with traditional elements from African and Indian religions.

In general, children in South America must attend primary school. However, in some remote areas people do not have access to schools. Nearly all South American cities have hospitals, but doctors and advanced medicines are not always available. The greatest health problems are in the rural districts, particularly in the low plains and river valleys of the tropics. There insects carry diseases such as malaria, and impure water is common. People who live in the

crowded, poorer city neighborhoods also have a higher risk of health problems.

Economy

For many years the economies of most South American countries were not well developed. Most people worked in agriculture, and there was not much industry. The countries also relied on foreign aid. But in the late 1900s many South American countries began to try to improve their economies by increasing manufacturing.

South America has great mineral wealth. It has about one fifth of the world's iron ore. South America also has large quantities of oil and natural gas. Copper, tin, lead, and zinc are mined in the Andes. Brazil mines many gems.

Agriculture is a large part of the South American economy. Cattle and sheep are raised throughout the continent. Argentina is a leading exporter of beef. Farmers also raise llamas and alpacas for their wool. Coffee, cacao, sugarcane, pine-

apples, and bananas grow in the tropical and subtropical regions. Farther from the equator, people grow corn, oranges, wheat, and vegetables. But some countries cannot produce enough food for their people. Those countries must import food.

Brazil is the leading manufacturing country in South America. Factories in Brazil and Argentina make cars and trucks. Clothing is made in a number of countries. Financial and business services are vital to every country in South America. Tourism has become increasingly important.

A Peruvian farmer leads a llama. In the Andes Mountains, especially in Bolivia, Peru, and Ecuador, people raise llamas for their wool.

History

American Indians have lived in South America for many thousands of years. By about 2000 BC several groups had societies with highly developed cultures. By at least the AD 1400s, these had developed into such large Indian groups as the Inca of the Andes Mountains, the Chibcha of Colombia, and the Guaraní of Paraguay. When the Europeans came to South America, the Inca Empire covered a large section of the continent.

European exploration of the continent began when Christopher Columbus arrived in the north in 1498. In the early 1500s Spanish and Portuguese sailors began exploring—and then taking over—large areas of the continent. The Portuguese gradually took possession of what is now Brazil. The Spanish claimed

the rest of the continent. They ruled over the Native Americans. The Spanish forced them to mine for gold and silver and to work the land. Huge numbers of Indians died from diseases they caught from the Europeans and from harsh working conditions. The Europeans brought enslaved Africans to the continent to replace the lost workers.

In the 1800s growing numbers of people in South America began to demand independence from Spain. The main revolutionary campaigns were directed by two outstanding military leaders: José de San Martín and Simón Bolívar. They were ultimately successful. By the middle of the century all the Spanish colonies had become independent nations. There was very little fighting in Brazil, however. In 1822 the Portuguese recognized Brazil as an independent empire. In 1889 the Brazilians formed a republic.

Many of the new countries in South America set up governments based on the democratic pattern of the United States and France. However, over the years military leaders have often seized power and created dictatorships. At the beginning of the 21st century, there were many economic problems in South America as well. A small number of rich people owned most of the land, farms, and businesses. Many more people lived in poverty.

The military leader Simón Bolívar helped South American countries to win independence in the 1800s.

South Australia

South Australia is one of Australia's six states. It contains some of the driest, emptiest areas of the country. Adelaide is the state's capital and main port.

Geography

South Australia borders Western Australia on the west; the Northern Territory on the north; Queensland, New South Wales, and Victoria on the east; and the Indian Ocean on the south. South Australia covers an area of 379,725 square miles (983,482 square kilometers).

South Australia's land is mostly low and flat. More than two thirds of the inland area is a dry region with little plant life and few people. In the northeast is a part of the Great Artesian Basin. The basin is the world's largest region of natural springs (water that flows from underground). The Murray River is the only major river in the state. It provides most of the water for Adelaide. The state has a dry climate, with cool winters and warm summers.

Plants and Animals

In the dry areas of South Australia few plants other than acacia trees and shrubs grow. Eucalyptus trees grow in the rainier areas of the south. People have also planted forests of pine trees in the southeast.

South Australia's animals include many types of birds and reptiles. The state is also home to many marsupial mammals (animals that usually carry their young in a pouch). These include kangaroos, possums, and the hairy-nosed wombat.

People

South Australia has a population of about 1.5 million. Most of the people have British or other European ancestors. Less than 2 percent of South Australians are Aborigines, the original people of Australia.

About three quarters of the state's people live in Adelaide. The other large cities are Whyalla, Mount Gambier, Port Augusta, and Port Pirie.

Clumps of grass grow in South Australia's Strzelecki Desert.

The Murray River is one of Australia's longest rivers. It flows through South Australia.

Economy

Many people in South Australia work in services—for example, health care, education, and retail shops. Many others work in manufacturing. The state's manufactured goods include cars, metal pipes, chemicals, paper, and cloth.

South Australian farmers grow grapes, vegetables, oranges, wheat, and barley. They also raise cattle, pigs, chickens, and sheep. The state produces most of Australia's wine and much of its wool.

Mining is another important part of the economy. Mines in South Australia pro-

vide iron, salt, and the mineral gypsum. The state is also a major world source of precious gems called opals. Large natural gas fields in the north produce much of Australia's natural gas supply.

History

Aborigines have lived in what is now South Australia for at least 23,000 years. Dutch explorers traveled along the coast in the 1600s. The British navigator Matthew Flinders explored the area in about 1802.

Colonists from Great Britain began to settle in South Australia in 1836. In the mid-1800s the colonists began to produce wheat, wool, and copper. This activity helped the colony to grow.

South Australia gained control of what is now the Northern Territory in 1863. When Australia gained independence from Britain in 1901, South Australia became a state. The Northern Territory was separated from the state in 1911.

The Adelaide Festival Centre is a group of theaters near the Torrens River in Adelaide, South Australia.

South Carolina

South Carolina was the first Southern state to withdraw from the United States on the eve of the American Civil War. South Carolina was also the site of the first battle of the war. The state capital is Columbia.

Geography

South Carolina is located in the southeastern part of the United States. The state borders North Carolina on the north, Georgia on the west, and the Atlantic Ocean on the east.

The southern and eastern parts of South Carolina are covered by a broad coastal plain. Along the coast are sandy islands separated from the mainland by marshes and lagoons. One of those islands is Hilton Head, a resort area off the state's southern tip. The western part of South Carolina is an area of rolling hills. A portion of the Blue Ridge Mountains rises in the northwest corner of the state. South Carolina has long, hot, humid summers and mild winters.

People

White people of European heritage account for about two thirds of South Carolina's population. The percentage of African Americans in South Carolina is more than double the national average. African Americans make up about 30 percent of the state's population; the national average is 12 percent. More than 2 percent of the population is Hispanic American.

Economy

Chemicals, metal products, and textiles (cloth goods) are leading manufactured goods in South Carolina. Historically, the state has been known for the production of textiles. Since the late 1990s, however, South Carolina's textile industry has declined. The main chemical products include plastic resins, dyes, and medical drugs.

Tourism is popular because of South Carolina's warm climate and beautiful coastline. Some of South Carolina's major agricultural products are chickens, turkeys, and tobacco.

History

Native American groups, including the Catawba, the Cherokee, and the Yama-see, lived in the area when Europeans first arrived. The first permanent English settlement was Charles Town, established in 1670 and named for King Charles II. In 1729 the colony was

divided into North Carolina and South Carolina.

South Carolina planters prospered during the colonial period. By 1775, however, the people of South Carolina were unhappy with British rule. They joined with other American colonies in fighting against the British during the American Revolution. Many of the war's battles were fought in South Carolina.

Cotton became the state's main crop after the invention of the cotton gin in 1793. The machine removed the seeds from raw cotton, making it easier to process. Slavery became widespread as a way to provide free labor for picking cotton on the plantations (large farms).

Like other Southern states, South Carolina disagreed with Northern states, which wanted to end slavery. These ten-

Crowds of people enjoy South Carolina's Myrtle Beach.

Historic homes and landmarks line the Battery, a park overlooking the harbor in Charleston, South Carolina.

sions eventually resulted in South Carolina leaving the Union on December 20, 1860, to join the Confederacy. The American Civil War began on April 12, 1861. On that day Confederate soldiers opened fire on Fort Sumter, a U.S. Army post near Charleston, South Carolina. The Confederacy lost the war in 1865. South Carolina rejoined the Union in 1868.

In the 20th century many New England textile mills relocated to Southern states such as South Carolina. Although pockets of poverty still existed in the state, the mills provided work for many South Carolinians. In 1989 Hurricane Hugo caused great damage to the South Carolina coast. In the early 21st century the textile industry in South Carolina suffered as foreign competition increased. But the state continued to attract tourists to resort areas such as Hilton Head Island and Myrtle Beach.

South Dakota

The U.S. state of South Dakota is named for the Dakota, or Sioux, Indians who first lived in the region. South Dakota is known as the Mount Rushmore State because of its most famous tourist attraction. The Mount Rushmore National Memorial is a huge, man-made sculpture carved into a granite mountainside. The sculpture features the faces of four U.S. presidents. The state capital is Pierre.

Geography

South Dakota is bordered on the south by Nebraska, on the west by Montana and Wyoming, on the north by North Dakota, and on the east by Minnesota and Iowa.

Eastern South Dakota is a flat prairie region. The western two thirds of the state consists of plains that are higher in elevation than the eastern prairies. The landscape in this area is broken by hills and canyons. Within the western plains is a large, rugged region called the Badlands. In the far west is a mountainous, forested area known as the Black Hills. The Black Hills are home to Mount Rushmore and to Harney Peak. With a height of 7,242 feet (2,207 meters), Harney Peak is the nation's highest point east of the Rocky Mountains.

The Missouri River runs downward through the middle of the state. It then turns eastward and becomes South Dakota's southeastern boundary with

Nebraska. South Dakota has warm summers and cold winters.

People

The great majority of the state's residents are of European heritage. Many are of German, Scandinavian, or Irish descent. Native Americans are the largest minority group, making up more than 8 percent of the population. Most of the approximately 62,000 Native Americans in South Dakota are Sioux.

Economy

Service industries such as tourism, trade, and financial services are the largest part of the state's economy. The main manufacturing industries include food processing and the production of computer and electronic goods. South Dakota's major crops are corn and soybeans. Cattle and hogs are also valuable.

The Mount Rushmore National Memorial in the Black Hills of southwestern South Dakota features the faces of George Washington, Thomas Jefferson, Theodore Roosevelt, and Abraham Lincoln.

History

Native Americans lived in the area for centuries before the arrival of Europeans. French explorers claimed the region for their country in the 1740s. France sold the land to the United States in 1803 as part of the Louisiana Purchase. The Lewis and Clark Expedition traveled through the region in 1804.

The first permanent European settlement in the area was a trading post established on the Missouri River in 1817. The Dakota Territory was created in 1861. White settlement in the area expanded after gold was discovered in the Black Hills in 1874. South Dakota was admitted to the Union as the 40th state in 1889.

Native Americans and white settlers fought wars from the 1850s to 1890. In that year U.S. troops massacred more than 200 Sioux in the battle of Wounded Knee. Afterward most Native Americans lived on reservations.

In 1973 members of the American Indian Movement occupied the town of Wounded Knee. They wanted to call attention to the needs of Native Americans. In 1979 the U.S. government gave the Sioux millions of dollars as repayment for forcing them from the Black Hills region. In the 1990s many tribes built casinos on reservation lands as a way of making money.

Space Exploration

Through space exploration humans have learned a great deal about the planets, stars, and other objects in space. More than 5,000 spacecraft have been launched into space to gather information since 1957. They include spacecraft with humans on board, space probes, and satellites.

Astronauts

Astronauts (called cosmonauts in Russia and taikonauts in China) go through a thorough training program. They study math and science in classrooms. They learn to operate their spacecraft by using computer-controlled simulators. These devices present astronauts with conditions that they will later experience during actual flight. Astronauts also make special trips in airplanes to get used to the feeling of weightlessness.

Humans cannot survive in outer space on their own. The environment is not the same as it is on Earth. Astronauts therefore travel in space in tightly sealed compartments. They bring their own

The space shuttle *Discovery* prepares to dock with the International Space Station in July 2006.

supply of oxygen with them. Once in space, astronauts may conduct scientific experiments. They also may make repairs to their spacecraft or other equipment in space.

The Race into Space

In the 1900s scientists developed rockets that could travel fast enough to overcome the pull of the force called gravity. This knowledge allowed the Soviet Union to launch the first artificial satellite on October 4, 1957. It was called Sputnik 1, and it orbited around Earth. On April 12, 1961, Yuri Gagarin became the first human to circle Earth in space. In 1963 Valentina Tereshkova became the first woman in space.

The National Aeronautics and Space Administration (NASA) took charge of the U.S. effort. The first U.S. satellite was launched on January 31, 1958. On May 5, 1961, astronaut Alan B. Shepard, Jr., became the first American to enter space. Shepard flew for only 15 minutes. On February 20, 1962, John H. Glenn, Jr., completed three orbits

around Earth. On July 20, 1969, astronaut Neil Armstrong became the first human to walk on the Moon.

Space Stations

Scientists began building space stations in the early 1970s. Space stations are spacecraft that stay in orbit for a long period of time. Scientists can spend days or even months at a station doing experiments. The Soviet station *Mir* stayed in orbit from 1986 to 2001.

In the 1990s, 16 countries agreed to build and operate a large space station together. The new project was called the International Space Station (ISS). The first crew began to live in the station in November 2000.

Space Shuttles

In 1981 the United States launched the first reusable spacecraft, called a space shuttle. The main section has wings and is called the orbiter. Attached to the orbiter are rockets, fuel tanks, and oxygen tanks. These boost the craft through the thickest part of Earth's atmosphere. When their fuel is used up, the boosters fall into the ocean, where they can be recovered. At the end of a mission, the orbiter returns to Earth and lands like an airplane.

The first shuttle missions were successful. Astronaut Sally Ride became the first U.S. woman in space on June 18, 1983. But in January 1986 the shuttle *Challenger* exploded 73 seconds after liftoff. All seven crew members were killed. NASA stopped the shuttle program to study the cause of the explosion.

Did You Know?

The space shuttles are used to bring astronauts and supplies to and from the space station.

They also allow scientists to conduct experiments in outer space.

Two robots were sent to the planet Mars in 2003. An artist's computer drawing provides an idea of what the robot Opportunity might look like on the planet.

The United States returned to space in September 1988 with the launching of the shuttle *Discovery*. The shuttles made many successful trips. But then in February 2003 the shuttle *Columbia* broke apart as it was returning to Earth. The seven crew members on board were killed. The shuttle program did not resume until 2005.

Space Probes

Space probes are vehicles that carry scientific equipment but no passengers. Some make one-way voyages into deep space. Probes are controlled from Earth by radio. They send back their findings the same way.

Probes have landed on Mars and Venus and have flown past Jupiter, Saturn, Uranus, and Neptune. They have collected information on the planets' atmospheres, moons, and ring systems.

Spain

Spain is a large country in western Europe. It once controlled a huge empire in the Americas. Spain's capital is Madrid.

Geography

Spain takes up most of the Iberian Peninsula, a block of land in southwestern Europe. Spain shares borders with Portugal, France, and Andorra. South of Spain is Gibraltar, a British colony. The Mediterranean Sea lies to the east and southeast. The Atlantic Ocean lies to the north, northwest, and southwest.

Two groups of islands also belong to Spain. The Canary Islands are in the Atlantic Ocean, northwest of Africa. The Balearic Islands are in the Mediterranean. In addition, Spain controls the cities of Ceuta and Melilla in northern Morocco.

Most of the land is a high plain in the center of the country. Mountain ranges surround the plain. The Pyrenees Mountains form a natural border between Spain and France. Spain has many rivers, including the Duero, the Tagus, and the Ebro.

Most of Spain has hot summers and cool winters. The south is drier than the north.

Plants and Animals

Meadows and forests cover northern Spain. Oak and pine trees grow in the

The Pyrenees Mountains are a feature of northeastern Spain.

mountains. Scattered evergreen oaks and grasses grow in central and southern Spain.

Spain's wildlife includes deer, wild boars, and ibex (a type of wild goat). The Pyrenees are home to many birds of prey, including eagles, owls, and buzzards.

A flamenco dancer whirls in a ruffled dress. Flamenco is a form of traditional music and dance of the Roma (Gypsy) people of southern Spain.

People

Most of the people of Spain are Spanish. Roma (or Gypsies) are the largest minority group. Roman Catholicism is the main religion. Most people live in cities or towns.

Most people in Spain speak Castilian, which is generally called Spanish. People in the east also speak Catalan. Those in the northwest also speak Gallego, or Galician. The Basque people of northern Spain also speak Euskara, or Basque.

Economy

Spain's economy depends on services, manufacturing, and mining. Tourism is one of the most important service industries. The country's manufacturers make clothing, shoes, food products, chemicals, metals, machinery, and cars. Spain's

mines provide coal, zinc, iron ore, lead, and other minerals.

Farming is a small part of the economy. Spain's crops include grains, sugar beets, olives, citrus fruits, and vegetables. Spain is also a major producer of wine. Farmers raise sheep, pigs, cattle, and goats. Fishing is another source of food.

History

Roman and Muslim Rule

In ancient times many different peoples from Europe and North Africa settled in Spain. The Romans ruled the region from the 200s BC to the AD 400s.

Muslim Arabs invaded in 711. They quickly captured most of the Iberian

The Spanish architect Antoni Gaudí designed many amazing buildings in the early 1900s. The church of the Holy Family in Barcelona, Spain, is one of his most famous buildings. It was still not finished in the early 21st century.

TIMELINE

Muslims invade Spain.		Spain's king becomes head of an empire in Europe and the Americas.		The Spanish Civil War breaks out.		Juan Carlos becomes king of Spain and makes Spain a democracy.
711	1492	1519	1701	1936	1939	1975
	Christians defeat the last Muslims in Spain.		The War of the Spanish Succession begins.		Dictator Francisco Franco takes power.	

Peninsula. The Muslims held power for more than 700 years.

Christian Spain

After many years Christian kingdoms in the north began to take back territory piece by piece. By the late 1200s the kingdoms of Castile and Aragon had conquered most of the area controlled by the Muslims. In 1469 Prince Ferdinand of Aragon married Princess Isabella of Castile. The two kingdoms were officially united in 1479. By that time Ferdinand had become king of Aragon and Isabella had become queen of Castile. In 1492 Castile and Aragon captured the last Muslim kingdom, Granada. Spain was then a united Christian country.

Ferdinand and Isabella banned all religions other than Roman Catholicism. A court called the Inquisition punished people who were not Catholic. Spain also forced thousands of Jews to leave the country.

World Empire

In 1492 Spanish ships commanded by Christopher Columbus reached the Americas. Spanish explorers soon claimed territories around the world for Spain.

Spain also stretched its empire through Europe. Charles, the grandson of Ferdinand and Isabella, belonged to a powerful family called the Hapsburgs. In 1516 he became the king of Spain. In 1519 he became Emperor Charles V of the Holy Roman Empire as well.

Loss of Power

Spain lost power in the 1600s, when the country fought many costly wars. In 1700 the last of the Spanish Hapsburgs died. Many European countries fought to take the Spanish throne in the War of the Spanish Succession. At the end of the war Spain lost its European territory. A French prince became king of Spain.

The Alhambra is a palace and fortress in Granada, Spain. The Muslim rulers of Granada built it during the 1200s and 1300s.

Most of Spain's overseas colonies won independence in the 1800s. Spain lost other territory to the United States after the Spanish-American War of 1898.

Civil War and Dictatorship

Spain became a democratic republic in 1931. However, a civil war broke out in 1936 between two Spanish groups. Rebel forces called the Nationalists fought the Republicans, who wanted to keep the republic form of government. The fighting was very fierce and destructive. The Nationalists won the civil war in 1939.

The Nationalist leader Francisco Franco soon took control of the country. He ruled Spain as a dictator (a ruler with unlimited power) for 36 years.

Recent Events

After Franco died in 1975, Spain became a kingdom again. King Juan Carlos made the country a constitutional monarchy. Spain then developed a closer relationship with other western European countries. It joined the European Community (now the European Union) in 1986.

Meanwhile, Spain faced a number of terrorist attacks. A group of Basques carried out many of the attacks. In 2004 terrorists from the Muslim group al-Qaeda blew up trains in Madrid.

Spanish-American War

The United States easily defeated Spain in the Spanish-American War of 1898. The war forced Spain to give up control of Cuba, the last of its colonies in the Americas. It also helped to make the United States a world power.

Path to War

Cuba is an island in the Caribbean Sea, close to the U.S. state of Florida. Spain ruled Cuba harshly. The people of Cuba rebelled against the Spanish in 1895. Many people in the United States wanted their government to help the Cubans. Owners of U.S. companies that did business in Cuba also wanted their government to act. They were afraid that a long revolution would hurt their companies.

William McKinley became president of the United States in 1897. At first he wanted to stay out of Cuba. Even so, he sent a warship called the *Maine* to Cuba to protect U.S. citizens. On February 15, 1898, an explosion sank the *Maine*. No one knew who set off the blast, but it made people in the United States even angrier at Spain.

Fighting the War

In April 1898 the U.S. Congress threatened Spain. Spain declared war on April 24. The United States declared war one day later. The war was fought both in the Caribbean and in the Philippines.

Soldiers in the Spanish-American War stand ready to defend their camp.

The Philippines is an island group in the Pacific Ocean that Spain then ruled as a colony.

On May 1 the U.S. Navy, led by George Dewey, destroyed all the Spanish warships in the Philippines. By August U.S. forces controlled Manila, the capital of the Philippines.

Meanwhile, U.S. forces attacked Spanish troops in Cuba. Among the U.S. forces were Theodore Roosevelt and his group of volunteer soldiers, called the Rough Riders. As they pushed into the city of Santiago, the Spanish ships in the city's harbor had to move out to sea. Then the U.S. Navy quickly defeated them. The Spanish surrendered on July 17.

Results

The United States and Spain signed a peace treaty in Paris, France, in Decem-

ber 1898. Spain gave up Cuba, which became an independent country. Spain gave the United States control of Puerto Rico (another Caribbean island) and the Pacific Ocean island of Guam. The United States paid Spain 20 million dollars for control of the Philippines.

The war made Theodore Roosevelt a national hero. He was elected vice president in 1900. He became president when President McKinley was assassinated in 1901.

Spanish Civil War

From 1936 to 1939, two opposing groups of citizens waged a bitter fight for control of Spain. The Spanish Civil

War fought a group called the Nationalists.

War decided Spain's government until the 1970s.

Background

In the decades after World War I (1914–18), politics in Spain became deeply divided. One group wanted things to stay as they were. This was the ruling class made up of wealthy landowners, businesspeople, military leaders, and conservative Roman Catholics. On the other side were those who wanted social change. This group included farm workers, labor union members, and educated middle-class people.

In 1931 King Alfonso XIII allowed elections to be held. When the people voted to set up a republic, the king fled the country. The people soon became dissatisfied with the new government, however. There were many demonstrations and protests. On February 16, 1936, elections were held to choose a new government. The groups that were pressing for reforms banded together as the Popular Front. They won the election.

War

But the people who had been the ruling class were not willing to give up control of Spain. They became known as Nationalists because they wanted to preserve the nation as it was. On July 17 they launched a military uprising against the government. General Francisco Franco led the uprising. This soon turned into war.

Franco got help from the governments of Italy and Germany. The Republican side (those who supported the Popular

Front) got help from the Communist government of the Soviet Union. The Republicans also had the aid of about 40,000 individuals from other countries. Groups of these foreign fighters became known as the International Brigades.

The Nationalists had two big advantages. They controlled the military, and they were united under Franco. The Republicans did not have enough weapons. They also began to fight among themselves.

The Nationalists steadily won territory in the north and south. In the spring of 1938 they moved east toward the Mediterranean seacoast. On March 28, 1939, they marched into Madrid, the capital city, without even having to fight. General Franco then had control of the entire country.

Results

The Spanish Civil War was very bloody. Between 500,000 and 600,000 people may have died, not counting those who starved or died from diseases. The foreign supporters of each side in the war fought each other again in World War II. That war started later in 1939, but Franco kept Spain out of the war. He ruled Spain as a dictator (ruler with unlimited power) until his death in 1975.

Spain

Sparrow

Many types of small, brownish or grayish songbird are called sparrows. They

are among the best-known birds in the world. They live in a wide range of places, including cities, farms, grasslands, woodlands, and marshes. Sparrows eat mostly seeds and insects.

Many types of sparrow look fairly similar. They all have cone-shaped bills, which they use to crush seeds. They all are small birds with various patterns and streaks. For instance, the house sparrow is about 5 to 6 inches (12 to 15 centimeters) long. It has brown or reddish brown upper parts and a gray underside. The male has black on the throat and around the eyes. The song sparrow is about the same size or slightly larger. Its wings and tail are reddish brown. Its breast is white with many dark streaks, often with a dark spot in the center.

Despite their similarities, not all sparrows are closely related. There are two main groups of sparrows: Old World sparrows and New World sparrows. These groups belong to separate bird families.

Old World Sparrows

Old World sparrows come from Europe, Asia, and Africa. However, some types have spread to other areas. For instance, the house sparrow is an Old World sparrow that is now common nearly all over the world. It is also called the English sparrow. Many people consider this tough, noisy bird a pest. It takes the nesting sites of bluebirds and other songbirds. Other Old World sparrows include the Eurasian tree sparrow and the chestnut sparrow.

Did You Know?

The dusky seaside sparrow was a type of sparrow that lived in Florida. In the 1900s people destroyed its habitat. The last such sparrow died in 1987.

A Eurasian tree sparrow perches in a holly bush.

New World Sparrows

New World sparrows are found in North America and South America. They are related to finches, buntings, and cardinals. The song sparrow is a New World bird named for its complex, musical songs. Among the many other types of New World sparrow are the chipping sparrow, the savannah sparrow, and the American tree sparrow.

Sparta

Sparta was a city-state of ancient Greece. It was the chief city of a region called Laconia. Spartans loved military strength and ruled harshly.

Society

Sparta was very different from Athens, another great city-state of ancient Greece. The Spartans did not care about art or philosophy. Instead they valued bravery, strength, and obedience.

At age 7, Spartan boys had to leave their parents. They grew up together in military style groups. They built up their bodies by exercising and playing sports. The strongest and bravest became captains. Girls also learned Spartan values, but their upbringing was less strict.

All male Spartan citizens became soldiers at age 20. Men retired from soldiering at age 60 and could then become elders.

Sparta had two kings who ruled together. A council of elders helped the kings to rule. Only citizens of Sparta could participate in the government.

A group of people who lived outside of the city worked in Sparta as merchants and craftspeople. A third group called the helots farmed the lands of the Spartans. The helots were almost like slaves. They made up most of the population of Laconia.

A Spartan warrior is pictured on a Greek vase from the 400s BC.

History

Sparta was most likely founded in the 800s BC. Spartan armies helped to fight off Persian invaders of Greece in wars called the Persian Wars (492–449 BC). Athens won the biggest victories in the Persian Wars. However, in the Peloponnesian War (431–404 BC), Sparta defeated Athens and became the most powerful Greek city.

Sparta's power did not last long. Later battles weakened many of the Greek city-states. By 339 BC King Philip II of Macedonia had conquered most of Greece, including Sparta. In the 100s BC, Roman armies took over Sparta. A Germanic group called the Visigoths destroyed the city in AD 396.

Special Olympics

Special Olympics is a worldwide organization that offers sports programs for people with intellectual (mental) disabilities. The programs are free and year-round. They include athletic training and competition in more than 20 sports. Special Olympics helps its athletes to gain physical fitness and self-confidence. It also helps them to gain the respect of their communities.

More than 1.7 million children and adults in more than 150 countries participate in Special Olympics activities. Every two years athletes from around the world participate in the Special Olympics

Children in a Special Olympics program take part in a 50-meter footrace.

World Games. The World Games alternate between Winter Games and Summer Games. Before the games begin, athletes take an oath that gladiators (professional fighters) used in ancient Rome: “Let me win. But if I cannot win, let me be brave in the attempt.”

Special Olympics was the idea of Eunice Kennedy Shriver. Shriver was a sister of U.S. president John F. Kennedy. In 1962 Shriver started a day camp at her home for children with intellectual disabilities. The Special Olympics programs grew from there. In 1968 the First International Special Olympics World Games took place in Chicago, Illinois.

Speech

Speech, or talking, is the form of language that people can hear. (Writing is the other main form of language.)

People use speech to communicate with others.

Speaking face-to-face is one of the many ways people communicate with one another.

From birth, babies make many different kinds of sounds. They learn to speak by copying the sounds that they hear around them. Children usually begin to say some words between the ages of 1 and 2. However, it takes years for a child to master the ability to speak.

How Humans Produce Speech

People speak by forming different sounds in a certain order. These sounds make up words that others can understand.

At the base of the throat is the larynx, or voice box. Inside the larynx are the vocal cords. These are a pair of stretchy folds that create the voice. When a person exhales air from the lungs, it passes between the vocal cords. The air makes the vocal cords vibrate, or tremble. This vibration creates sounds. The larynx

makes these sounds louder. Then they pass through the throat, mouth, and nose.

Sounds simply passing out of the mouth are not speech. People use the tongue, teeth, lips, jaw, and palate (roof of the mouth) to shape the sounds to make words. For example, placing the tongue between the teeth makes a “th” sound.

Speech Disorders

Sometimes people have speech disorders, or problems with speech. Children often develop a lisp as they are learning to speak. A lisp is the use of a “th” sound for “s” and “z” sounds. Some children develop a stutter. Stuttering includes repeating sounds, making sounds longer than normal, or pausing before making sounds. People who suffer a head injury or a stroke may develop aphasia. This disorder makes it difficult for a person to speak or to understand speech.

Do Animals Speak?

Animals do not use language in the same way that people do. But many animals do communicate using sounds. For example, dogs can whine, bark, growl, snarl, and howl. These sounds may express fear, danger, hunger, or other information. Some birds, such as the gray parrot, can even copy human speech. Nevertheless, humans are the only animals that can use speech to express complicated ideas.

Sphinx

The sphinx is a creature in mythology. It has the body of a lion and the head of a human. Sphinxes appear in the art and legends of ancient Egypt and ancient Greece.

Ancient Egyptians made many large statues of sphinxes. The city of Luxor has a street lined with sphinxes. The largest and most famous Egyptian sphinx was carved near the pyramids of Giza in about 2500 BC. Called the Great Sphinx, it has the head of an Egyptian king.

The ancient Greeks started creating sphinxes in about 1600 BC. Their sphinxes had wings. Later Greek sphinxes were always female. A story of Greek mythology tells that the Sphinx of Thebes asked a riddle and ate people who could not solve it. She asked, “What animal walks on four legs in the morning, two legs at noon, and three

legs at night?” Eventually the Greek hero Oedipus gave the correct answer: a person. (A person crawls on all fours as an infant, walks on two legs when grown, and leans on a cane in old age.) Then the Sphinx killed herself.

Spice

Spices are the dried parts of various plants that have strong fragrances or flavors. People use spices to flavor foods. They also use the oils of spice plants to make perfumes, cosmetics, toiletries, and toothpastes. Spices have played an important role in world history. The search for spices led many explorers to discover new lands.

Spices come from the seeds, fruits, or other parts of certain plants. Cardamom, black pepper, coriander, poppy, sesame, and nutmeg are seeds. Cloves are flower buds, and chilies and allspice are fruits. Cinnamon is made from the bark of a tree. Ginger and turmeric are roots. When leaves of certain plants are used in a way similar to spices, they are usually known as herbs.

In ancient times people used spices in medicines and skin creams. They used them in religious ceremonies, too. Sometimes people used spices to keep foods from spoiling. They also used spices to hide the bad flavor of meats that had already spoiled.

Did You Know?

Black pepper is probably the most popular spice. It comes from a vine that was originally found in India.

The Great Sphinx at Giza, Egypt, is a huge statue that is roughly 4,500 years old. It has the body of a lion and the head of an ancient Egyptian king.

Many kinds of colorful spices are sold in markets.

Most spice plants grow in warm regions. Hundreds of years ago, the people of Europe had to get many of their spices from India and several islands that are now part of Indonesia. Traders used ships and camel caravans for transportation. The journey sometimes took as long as two years. This made spices very expensive. In the 1400s Europeans began searching for sea routes to East Asia that would make getting spices easier. These explorations led to the European discovery of the Americas.

Spider

Spiders are eight-legged creatures known for making silk webs to catch insects. They live everywhere in the world except for Antarctica. There are about 38,000 species, or types, of spider. They are related to scorpions, ticks, and mites.

Physical Features

Spiders are about 0.02 to 3.5 inches (0.5 to 90 millimeters) long. The largest spiders are tarantulas. A spider's body is separated into two parts: the cephalothorax and the abdomen. The cephalothorax contains the stomach and brain. The legs are attached to this part of the body. The abdomen contains the gut, the heart, the reproductive parts, and the silk-making parts.

Spiders have four pairs of legs. The legs may have claws at the tip. A few species use the first pair of legs as feelers to find prey.

Spiders have silk-making organs called spinnerets near the back of their body. They spin silk from a liquid made by special glands. It becomes solid thread after the spider pushes it out of its body.

Many spiders make venom, or poison, that they shoot into their prey. The

A spider waits for insects to fly into its sticky silk web.

venom of most spiders is not harmful to people. But a few spiders, including the black widow and the brown recluse, can cause pain and sometimes death in humans.

Behavior

Spiders feed mostly on insects. Some spiders are hunters that chase and overpower their prey. These spiders typically have a good sense of touch or sight. Other spiders instead weave silk webs to trap flying insects. Some spiders also use silk to wrap their prey, protect their eggs, or make nests.

Spiders are the only animals that digest their food outside their bodies. After capturing its prey, a spider covers it with digestive juices. The juices break down the prey's body into a liquid form that the spider sucks up. Spiders repeat this process many times and eventually digest most of the prey.

Life Cycle

Female spiders lay egg sacs that hold several to a thousand eggs. The young of most species go off on their own when they come out of the egg sac. Spiders change little in appearance as they grow. They molt, or shed their outer covering, multiple times before becoming adults.

mineral iron. The scientific name of spinach is *Spinacia oleracea*.

Spinach is widely grown in northern Europe and the United States. Growing spinach requires cool weather and rich, moist soil. Spinach is one of only a few vegetables that can live through some frost.

The spinach plant is an annual. This means that it grows for only one season and must be replanted each year. People grow spinach to eat its leaves. Spinach leaves can be either smooth or wrinkled. They are roughly triangular in shape. The leaves are clustered in a circle called a rosette.

Spinach is sold fresh, canned, and frozen. People eat it as a salad green or as a cooked vegetable. It also can be used to make soups and dips.

Spokane

The Spokane are Native Americans of northeastern Washington State. They traditionally lived along the Spokane River. The city of Spokane, Washington, was named after the tribe.

The Spokane hunted deer, elk, antelope, and other animals. They also gathered wild plants and fished, especially for salmon. In the 1730s they were introduced to horses. They used the horses to hunt bison (buffalo) on the plains to the east.

The Spokane built cone-shaped homes made of pole frames covered with mats or animal skins. They moved these homes from place to place while on the

hunt. The Spokane also built larger, rectangular houses in shallow pits.

By the early 1800s white settlers had set up trading posts in Spokane territory. At first the Spokane welcomed the newcomers. But the tribe became angry as the number of settlers grew. In 1858 the Spokane joined the Coeur d'Alene and other Native American neighbors in a war against U.S. troops. The war is known as the Spokane War or the Coeur d'Alene War. The Native Americans were defeated. They had to give up some of their land.

In the 1870s and 1880s the Spokane agreed to settle on reservations. In 1881 the United States set up the Spokane Reservation northwest of the city of Spokane. At the end of the 20th century there were about 2,000 Spokane living in the United States. Many lived on the reservation.

Sponge

Sponges are unusual animals that live in water. They do not have the body parts that most animals have. They do not even move around. Instead sponges stay attached to an underwater rock or coral reef. For a long time people thought sponges were plants. Scientists decided that sponges are animals only after watching them eat food by drawing it into their bodies.

An orange sponge is shaped somewhat like a fan. Sponges vary greatly in color, shape, and size.

There are nearly 5,000 different species, or kinds, of sponge. Most live in the ocean, but some live in freshwater. Sponges can be flat like spreading moss. Or they can look like trees with branching arms. Some are as small as a bean, while others are as tall as a person. Sponges can be smooth and mushy, or they can be rough, hard, and prickly. Some are dull and drab, but others are brightly colored.

A sponge's body is a soft mass of cells supported by a skeleton. Holes in a sponge's skin let water flow inside. Sponges take food and oxygen from the water. They do not have organs for breathing, eating, and getting rid of wastes. Each cell has to do these things.

Sponges are useful to people. People collect sponges and then dry, clean, and trim them. The fleshy parts are thrown away, and only the skeleton is used. The ancient Greeks and Romans used sponges to pad their war helmets and armor. People still use sponges for bath-

ing, mopping, and painting. However, most of the sponges used today do not come from animals. They are products made in factories.

Sports

A sport is a physical activity that people do for fun and as a way to compete with others. People have enjoyed sports for thousands of years. Every sport has a set of rules that the players follow.

Types of Sports

In some sports one person competes against other individuals. Examples of these sports include boxing, wrestling, gymnastics, figure skating, diving, pole vaulting, and horseback riding.

Soccer is a popular team sport for children and adults around the world.

Did You Know?

The physical activity of sports can make people healthier.

In team sports a group of people plays against another group, or team. A team may have as few as two members, or it may have many members. A doubles team in tennis has two players. Five players make up a basketball team. An ice hockey team has six players, and a baseball team has nine. Eleven players make up a football, soccer, or cricket team.

Sports can be amateur or professional. Amateur athletes do not get paid for participating in a sport. Professional athletes play for money.

Sports also can be organized or unorganized. Children who get together for neighborhood football games are playing unorganized sports. No organization controls their games. In organized sports athletes play for a school, a business, a club, a community, or some other organization. The organization schedules games and enforces the rules of the sport. Organized sports can be amateur or professional.

History

Since ancient times people have run races, wrestled, and hunted for sport. Ancient people in many parts of the world also played games with balls.

In some ancient cultures sports were a part of religious practices. This was especially true of the Greek Olympic Games, which began in 776 BC. The ancient Greeks played these games to honor their gods.

The ancient Romans related athletic games to military skills, not religion. They did such sports as boxing, wrestling, chariot racing, and throwing spearlike sticks called javelins.

After ancient times people continued to play sports, but they were usually unorganized. Organized sports became more common in the 1700s and 1800s. People created leagues and other organizations to control athletic competitions. They also wrote down sets of rules for different sports.

Springfield

Population
(2000 census)
111,454;
(2007 estimate)
117,090

Springfield is the capital of the U.S. state of Illinois. The city lies on the Sangamon River. Abraham Lincoln lived in Springfield for more than 20 years before he became the president of the United States.

A statue of U.S. President Abraham Lincoln stands near the state Capitol in Springfield, Illinois. Lincoln lived in Springfield before he became president.

Many people in Springfield work for the government. Many others work in service industries such as health care, tourism, communications, or insurance. The city is also a trading center for crops and livestock produced on nearby farms.

In about 1818 a man named Elisha Kelly built a cabin in what is now Springfield. He was the city's first settler.

Lincoln and eight other Illinois lawmakers helped make Springfield the capital of Illinois in 1837. Lincoln lived in the city from 1837 until he became president in 1861. Today tourists can visit Lincoln's tomb and former home in Springfield. The Abraham Lincoln Presidential Library and Museum was opened in the city in 2005.

Spy

A spy is a person whose job is to get secret information. Governments and businesses hire spies. Spies try to keep others from discovering who they are and what they do. The work of spying is also called espionage.

Spy Work

Spying often takes place during wartime. Spies for one side try to find out what the enemy is planning. Government spies may also gather information about other countries during peacetime.

A different type of spy works in business. These spies try to get information about products or processes that other companies keep secret.

Spies usually gather information that people cannot get in ordinary or legal ways. They may buy or steal secret information from people. They may use cam-

Some spies use cleverly hidden microphones to listen in on secret conversations. Microphones disguised in a piece of wood and in the heel of a shoe are displayed at the International Spy Museum in Washington, D.C.

eras, microphones, or other technology to gather information. Some spies pretend to work for one government or business while actually spying on it for another government or business. These spies are called double agents or moles.

Spy History

Spying has gone on since ancient times. The ancient Egyptians and Chinese used spies more than 2,000 years ago. European kings and queens almost always had spies. These spies kept track of enemies at home and in other countries.

Spies were an important part of the American Revolution and the American Civil War. Spies also played major roles in World War I, World War II, and the Cold War.

In the 1900s many governments created organizations to collect secret information about enemies. The KGB was the main spying group for the Soviet Union. The British Secret Intelligence Service (also called MI6) and the U.S. Central Intelligence Agency (CIA) are still active today.

War

Squanto

Squanto was a Native American who helped the Pilgrims of Plymouth Colony. He belonged to the Pawtuxet tribe of Massachusetts and Rhode Island.

Squanto served as a guide for the Pilgrims, who were unfamiliar with the land.

Little is known about Squanto's early life. According to one story, explorers took Squanto to England in 1605. Captain John Smith brought him back to North America nine years later. Then one of Smith's men kidnapped Squanto and sold him into slavery in Spain. Squanto escaped to England. Upon returning to North America, he found that disease had killed the other Pawtuxet. Squanto went to live with the Wampanoag.

Squanto met the Pilgrims in 1621. Their settlement was on Wampanoag land. Squanto could talk to the Pilgrims because he knew the English language. He showed them how to plant crops and where to fish. He also helped them work out a peace treaty with Massasoit, chief of the Wampanoag.

The governor of Plymouth Colony made Squanto his representative to the

Did You Know?

Nathan Hale was one of the first U.S. spies. He was caught and killed by the British during the American Revolution (1775–1783).

Indian groups. But Squanto sometimes abused his power. The Indians began to distrust him. In 1622 Squanto falsely told the colonists that Massasoit was planning to attack Plymouth. The Pilgrims found him out, but they let him stay in Plymouth and protected him from Massasoit. Squanto died in what is now Chatham, Massachusetts, in November 1622.

Squash

Squashes are fruits that are grown throughout the world in all but the coldest climates. They are related to gourds, melons, and cucumbers. Some types of pumpkin are also called squashes.

Squashes grow on plants with large, dark green leaves. The trumpet-shaped flowers range in color from yellow to orange. The fruits can be round, oval, or shaped like a shell. Their color can be white,

yellow, orange, green, gray, or speckled or striped. The rind, or skin, can be smooth or covered with bumps.

Squashes are divided into summer squashes and winter squashes. Despite the names, both types grow throughout the year. Summer squashes typically grow on bushes. They are much softer than winter squashes. They contain soft seeds that can be eaten. Summer squashes must be eaten soon after they are picked. Zucchini and yellow squash are types of summer squash.

Winter squashes grow on long vines. They are usually much larger than summer squashes. They have a thick, hard rind and seeds that are not eaten. Winter squashes will last for months after being picked. Acorn and butternut squashes are types of winter squash.

Squashes are often cooked as side dishes or used in soups. Zucchini and other summer squashes can be added to breads or muffins. The flowers of squash plants are also sometimes eaten. Squashes are used as food for farm animals, too.

Squid

Squid are mollusks that live in the ocean. Mollusks are a group of animals with soft bodies. Squid are closely related to octopuses, but they have 10 arms instead of 8. Squid can live either near the coast or in very deep water far out in the ocean.

Did You Know?

Native Americans were probably the first people to grow squashes.

Gardens produce many summer squashes.

The 10 arms of a reef squid are arranged in a circle around its mouth.

A squid has a long, tube-shaped body with a short head. A shell supports the body from the inside. Giant squid can be 60 feet (18 meters) long and weigh 1,000 pounds (454 kilograms). Some other squid are less than an inch (2.5 centimeters) long. A squid has large eyes, usually on the sides of its head. Two of a squid's 10 arms are longer than the others. Suckers on the long arms help the squid catch fish and shellfish to eat.

Squid can be fast swimmers, or they can just drift along. Whales, sea birds, and other animals eat squid. Squid often use their speed to escape enemies. They also can hide from enemies by changing color to blend in with rocks or seaweed. Like an octopus, a squid can spray a cloud of inky fluid into the water to confuse the enemy.

After mating, a female squid lays hundreds to thousands of eggs. The eggs are grouped together in jellylike strands. The female leaves the eggs

alone to develop. Within several weeks they hatch into a small form of the adult.

Squirrel

Squirrels are rodents that have long bushy tails. In many cities squirrels are seen more often than any other wild mammal. The squirrel family also includes groundhogs, prairie dogs, and chipmunks. There are more than 250 different animals in the family.

Squirrels live on all continents except Australia and Antarctica. Tree squirrels make their homes in trees. Ground squirrels live in burrows, or holes, under prairies, deserts, and fields.

The Eurasian red squirrel is a common squirrel of Europe and Asia.

Squirrels are small. The African pygmy squirrels are the smallest. They are only about 4 inches (10 centimeters) long. The largest are the giant squirrels of Asia. They can be 36 inches (90 centimeters) long and weigh 6.5 pounds (3 kilograms). Most squirrels have large eyes and short fur.

Squirrels are known for their quick movements. Tree squirrels can make great leaps between branches. Flying squirrels can glide through the air by leaping and then spreading out the flaps of skin that connect their front and hind legs. The skin acts like a parachute. Some flying squirrels can glide almost 1,500 feet (450 meters).

Squirrels have four large front teeth. These teeth are used for gnawing. They grow throughout the animal's life. Squirrels eat mostly plants, including berries and tree bark. Most squirrels eat a lot of seeds and nuts. Tree squirrels bury nuts in the ground to eat later.

Most tree squirrels are active year-round. But many ground squirrels spend the winter in their burrows in a state of inactivity called hibernation.

Some squirrels are considered pests because they eat farm crops. Others carry diseases. Some squirrels are hunted for their fur. People also eat squirrel meat.

Sri Jayewardenepura Kotte

Population
(2004 estimate)
120,800

Sri Jayewardenepura Kotte is one of the two capitals of Sri Lanka, an island country in the Indian Ocean. It is where Sri Lanka's lawmakers and highest court meet. It is a suburb of Colombo, Sri Lanka's other capital. The offices of the country's president and prime minister are in Colombo.

Sri Jayewardenepura Kotte was originally named Kotte. The city dates back to the 1300s. The rulers of the Sinhalese people built their capital at Kotte in 1415. In 1565 the Sinhalese moved their capital to Colombo.

Colombo later became the capital of Sri Lanka. In the 1980s the Sri Lankan government was running out of office space in Colombo. Officials then began developing Sri Jayewardenepura Kotte as another capital. Some of the government offices were moved there.

► More to explore

Colombo • Sri Lanka

Sri Lanka

The country of Sri Lanka occupies a pear-shaped island in the Indian Ocean. It was once a British colony known as Ceylon. Sri Lanka has two capitals, Colombo and Sri Jayewardenepura Kotte.

Geography

Sri Lanka lies about 18 miles (29 kilometers) from the southeastern tip of India. The waterway separating Sri Lanka from India is called the Palk Strait.

Flat or hilly plains make up most of Sri Lanka's land. There are high mountains and deep river valleys in the south-central part of the country. The longest river is the Mahaweli.

Because Sri Lanka is near the equator, it has warm weather year-round. The southwest receives heavy rainfall. The rest of the island is much drier.

The stilt fishers of Sri Lanka catch fish in shallow water while clinging to a pole.

Plants and Animals

The wet areas of Sri Lanka have tropical evergreen forests. Trees that shed their leaves grow in the drier regions. The driest areas have thorny shrubs and other plants that can survive without much water.

Leopards, bears, wild pigs, elephants, peacocks, and monkeys live in the forests. The government has created a number of national parks to protect the country's wildlife.

People

The Sinhalese people make up nearly three fourths of the population. They speak the Sinhala language and practice Buddhism. Tamils form the next-largest group. They speak Tamil, a language also spoken in southern India. The Tamils practice Hinduism, the main

religion of India. Muslims, who are also called Moors, make up Sri Lanka's third major group. They follow Islam and mostly speak Tamil. Many Sri Lankans also speak English. Most people live in villages.

Economy

Services—including telecommunications, insurance, and banking—have become key parts of Sri Lanka's economy. Manufacturing and mining are also important. Sri Lanka produces clothing, tea, rubber products, processed foods, tobacco, and chemicals. The country mines graphite (which is used to make pencils) and gems.

Many Sri Lankans grow rice and other crops to feed their families. Tea, rubber trees, and coconuts are grown on large farms called plantations.

History

The first people on the island were the Vedda. In about the 400s BC they began to mix with settlers from India. The

island's people came to be known as the Sinhalese. They later built an advanced Buddhist civilization. Beginning in the AD 900s Tamil invaders from India pushed the Sinhalese to the southwest. In the 1300s the Tamils set up a kingdom in the north.

European Control

The Portuguese arrived in 1505. By 1619 they controlled most of the island. The Dutch took over beginning in 1658. In the late 1700s the British took the island from the Dutch. The British called the island Ceylon. They grew coffee at first and then tea, rubber, and coconuts. Ceylon gained independence from Great Britain in 1948. The country adopted a new constitution in 1972 that changed the name to Sri Lanka.

Independence

The Sinhalese dominated the country's government. They supported the Sinhala language and Buddhism over other languages and religions. The island's Tamils soon wanted to set up a separate Tamil homeland in the northeast. In the 1980s heavy fighting broke out between Tamil groups and the Sri Lankan government. Tamil terrorist attacks continued into the 21st century.

In 2004 a tsunami, or huge wave, struck Sri Lanka. Tens of thousands of people were killed.

Stalin, Joseph

Joseph Stalin

Joseph Stalin led the country known as the Soviet Union for about 25 years. He made the Soviet Union into a world power, but he was known for his harsh rule.

Early Life

Joseph Stalin was born on December 21, 1879, in the country of Georgia. Georgia was then a part of Russia. Stalin's Georgian name was Ioseb Dzhughashvili.

As a young man Stalin became interested in Communism. Communists believe that all citizens should get an equal share of their country's wealth.

In 1903 the Communists of Russia split into two groups, Bolsheviks and Mensheviks. Stalin joined the Bolsheviks. Their leader was Vladimir Lenin. Stalin tried to get people to revolt against the Russian tsar. Because of this he was imprisoned several times.

Rise to Power

In 1912 Stalin became a party leader. By 1913 he was using the name of Stalin, which is based on the Russian word for "steel."

The Russian Revolution of 1917 brought down the Russian emperor. By 1921 the Bolsheviks, now known as the Communist Party, had all the power.

Lenin died in 1924. By then, the Communists had formed a new country called the Soviet Union. Party leaders fought for power, and Stalin came out on top.

Stalin wanted to make his country stronger and more modern. He built steel mills and factories. In 1928 he ordered small farms to be joined together. Farmers who resisted were shot or sent to punishment camps.

Starting in 1934, Stalin ordered his secret police to arrest and shoot many party members and army officers. He wanted to get rid of all possible threats to his power.

Later Years

In 1941 the Soviet Union entered World War II on the side of the Allies (including the United States and Great Britain). Soviet armies helped to win the war.

After the war Stalin turned against the Allies. His armies brought Communist rule to eastern European countries. Sta-

lin remained in power until his death on March 5, 1953.

Stamp

Stamps are small, sticky labels sold by postal services. They are also called postage stamps. People buy stamps as a way to pay for the service of mailing a letter or package. They attach stamps to letters and packages before sending them. The postal service cancels, or marks, stamps before delivering the mail. The purpose of cancellation is to prevent people from using the same stamp a second time.

Kinds of Stamps

Postal services sell regular stamps in many different values—from 1 cent, for example, to 5 dollars or more. The more expensive stamps are used to pay for the

In 1918 the U.S. Post Office printed an airplane picture on a stamp upside down by mistake. It sold only 100 of these stamps. Today each one is worth thousands of dollars.

delivery of heavy packages or for speedy delivery.

Most countries also issue special stamps for limited periods of time. Some special stamps honor people and groups. Others call attention to important issues. Such stamps are often large and colorful.

Stamp Collecting

Some people collect stamps as a hobby. Stamp collecting is called philately. Stamp collectors, or philatelists, get stamps by soaking them off letters. They also buy stamps from the post office or shops. Collectors keep their stamps clean by using a tool called stamp tongs to handle them. They carefully place their stamps in books called albums.

Collectors learn how to identify rare and valuable stamps. Stamps that are worth thousands of dollars sometimes look almost exactly like other stamps that are worth only a few cents. One rare U.S. stamp that is easy to identify is a 24-cent airmail stamp of 1918. It was printed by mistake with the airplane upside down.

History

An English schoolteacher named Rowland Hill invented the postage stamp. The United Kingdom issued the first stamps in 1840. The first U.S. postage stamps appeared in 1847.

Early stamps were printed on sheets of paper with no easy way to separate them from each other. People had to cut the stamps apart with scissors. In the 1850s stamp makers started punching rows of

Did You Know?

The stamps of the United Kingdom always include a picture of the king or queen as part of the design.

holes called perforations between the stamps.

Until the late 20th century people licked stamps to make them sticky before attaching them to letters. Then postal services started making stamps that stuck without being licked.

Stanton, Elizabeth Cady

Elizabeth Cady Stanton

Elizabeth Cady Stanton helped to start the women's rights movement in the United States. She led the fight to give women the right to vote in elections.

Early Life

Elizabeth Cady was born in Johnstown, New York, on November 12, 1815. She was a good student, but she could not

go to college. Colleges did not accept women then. Instead, she attended Troy Female Seminary in New York. In 1840 she married a lawyer named Henry Stanton.

Career

Stanton thought it was unfair that women had fewer rights than men. In 1848 Stanton and her friend Lucretia Mott held a meeting in Seneca Falls, New York. It was the first women's rights meeting in the United States. Stanton helped to write a statement that called for many kinds of rights for women, especially voting rights.

After 1851 Stanton worked closely with another women's rights activist named Susan B. Anthony. Stanton and Anthony gave speeches, talked to politicians, and wrote books and pamphlets on women's rights.

After the American Civil War (1861–65), the 15th Amendment to the U.S. Constitution gave voting rights to men of all races. Stanton was angry that women were not included. She organized and led clubs for people who wanted voting rights for women.

Stanton had other interests besides voting rights. Women then found it hard to divorce their husbands. She wanted to make it easier. Married women also had to give everything they owned to their husbands. Stanton wanted married women to keep their own money and property.

Stanton died in New York City on October 26, 1902. Women in the United States gained the right to vote in 1920.

Star

Stars are huge, glowing balls of gases. The closest star to Earth is the sun. Most of the pinpricks of light that shine in the night sky are also stars. Countless more stars are too far from Earth to be seen without a telescope. Most stars are incredibly far away.

Stars are found in huge groups called galaxies. The sun and its solar system, including Earth, are part of the Milky Way galaxy. That galaxy alone contains hundreds of billions of stars. There are many billions of galaxies in the universe.

Source of Energy

Nearly all stars are made up mostly of a gas called hydrogen. A star's core is very

Stars are found in large groups called galaxies. A galaxy may contain millions or even hundreds of billions of stars, plus gas and dust.

hot. Great pressure squeezes the core, causing some of the hydrogen to change into a gas called helium. This process produces huge amounts of energy and makes the star shine.

Physical Features

Stars vary in size, temperature, brightness, and color. A star's temperature, as well as its chemicals, makes it shine in a certain color. The bluer stars are usually hotter, while the redder stars are cooler. The sun is somewhere in between. It

A time line shows the stages in the life of a medium-sized star.

Did You Know?

For thousands of years people have imagined that certain stars in the sky form outlines of pictures. These pictures are called constellations.

gives off yellow light. The sun is a fairly average star in terms of its brightness and size.

Life of a Star

Stars probably begin as clouds of hydrogen and dust. This material slowly pulls itself together into clumps. As the material gets packed in tighter, the clumps get hotter. Pressure builds up. Eventually the star begins changing hydrogen into helium—and so begins to shine brightly.

After shining for billions of years, a star uses up all its hydrogen. Small and medium-sized stars slowly cool down and stop shining. This will happen to the sun billions of years in the future.

Large stars end with a violent explosion called a supernova. After that the material gets crushed much smaller. It no longer shines. Huge stars may end up as objects called black holes. The crushed material is so heavy for its size that it develops a powerful inward pull. This pull, called gravity, is so strong that it sucks in anything that gets near the black hole.

Starfish

Starfish are animals that live in all the world's oceans. They have five arms and look like stars. But they are not fish. Fish have backbones; starfish do not.

There are about 1,800 species, or kinds, of starfish. They can be brown, red, orange, pink, or other colors. Most starfish are 8 to 12 inches (20 to 30 centimeters) across. The body has a disk in the center with five or more arms attached. The disk and the arms are covered with short spines. Many starfish can grow another arm if they lose one.

A starfish moves using hundreds of tube feet on its underside. The tube feet are like little legs. In most starfish each tube foot has a suction cup on the end. These are good for creeping and clinging to steep surfaces.

Most starfish eat clams, oysters, and snails. They use their tube feet to pull apart the shells of larger prey. Some starfish sweep food into the mouth, which is on the underside of the body. Others turn the stomach outward to take in their prey. Certain starfish swallow the prey whole.

A starfish clings to a piece of coral in the ocean.

State Government

The United States has 50 state governments as well as a national government. This type of government system is called a federal system. Other countries that have a federal system include Australia, Canada, Germany, and Switzerland. These systems are different in some ways from the U.S. system. Some countries call their regions provinces or cantons instead of states. But there are many similarities. Each country's constitution gives its regions specific powers. The national government (also called the federal government) has other powers that apply to everyone in the country. Each region has its own executive (leader such as a governor), legislature, and court system. In addition, each region sends representatives to a national legislature.

The U.S. Federal System

The founders of the United States did not want a strong national government. But the first U.S. constitution, called the Articles of Confederation, made the government so weak that the country could not hold together. For this reason, the writers of the U.S. Constitution balanced power between a large central government and the smaller governments of the states.

The Constitution also balances power between large and small states. This is shown in the way the two houses of the U.S. Congress are organized. The more people a state has, the more members it

One role of the state governments in the United States is to issue license plates.

gets to send to the House of Representatives. This favors large states. But every state, whether large or small, gets to send two members to the Senate. This favors small states.

The U.S. Constitution lists certain things that state governments cannot do. For example, states must not make agreements called treaties with other countries. Apart from these few rules, state governments have much freedom. In fact, the 10th Amendment to the Constitution gives all powers to the states, except where the Constitution specifically says otherwise.

U.S. State Governments

U.S. state governments are organized much like the federal government. Every state has a constitution. Almost every state has a legislature with an upper house and a lower house. (Nebraska has a one-house legislature.) Every state has a governor who serves as the chief executive (president). Every state has a high

In the United States, state governments issue drivers' licenses. In most states, the Department of Motor Vehicles handles this task.

court, usually called the supreme court. The high court judges state laws in much the same way as the U.S. Supreme Court judges federal laws.

States also have the power to tax their people to pay for state programs. States pay for education and health care, as well as for the building of roads, bridges, and other projects.

States' Rights

State law may not go against federal law. Even so, U.S. states have sometimes claimed that a certain federal law did not apply to them. South Carolina tried to ignore a federal tax law in 1832. When President Andrew Jackson threatened to send in the army, the state backed down. Beginning in 1860, the Southern states claimed the right to

secede, or separate from the rest of the country, over the issue of slavery. This time they did not back down. The result was the American Civil War (1861–65), which is sometimes called the War Between the States. Since then the issue of states' rights has come up whenever a state disagrees with the federal government.

Statistics

Statistics is a branch of mathematics. It involves gathering information, summarizing it, and deciding what it means. The numbers that result from this work are also called statistics. They can help to predict such things as the weather and how sports teams will perform. They also can describe specific things about

A worker gathers information from a weather station. Such stations record many statistics, including temperatures, wind speeds, and rainfall amounts. Scientists can then study the statistics to learn about weather patterns in an area.

large groups of people—for example, the reading level of students, the opinions of voters, or the average weight of a city's residents.

Collecting Data

The people who gather statistics are called statisticians. They collect pieces of information, or data, in three basic ways. They refer to trustworthy sources, such as newspapers and reports from reliable organizations. They perform scientific experiments. They also conduct surveys, or ask people questions.

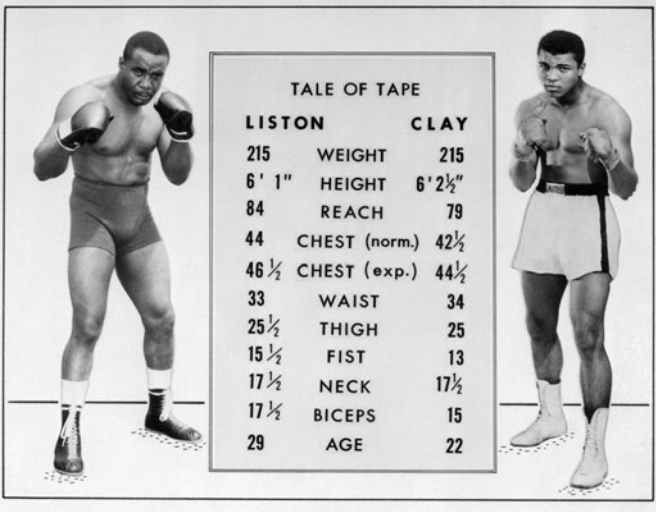

Sometimes statisticians cannot gather data about every member of a group, often because the group is too large. In such cases they study only part of the group, called a sample. A sample must accurately represent the larger population. For example, if women make up 60 percent of the population, then 60 percent of the sample must be women.

Summarizing Data

Once statisticians have collected their information, they summarize it. They often put the data in graphs or charts, which are easier to read than long lists of data.

Statisticians also summarize data by calculating numbers called averages. There are three kinds of averages: mean, mode, and median.

The mean is the sum of a set of numbers divided by the amount of numbers in the set. If 100 people weigh a total of

LISTON		CLAY
215	WEIGHT	215
6' 1"	HEIGHT	6' 2½"
84	REACH	79
44	CHEST (norm.)	42½
46½	CHEST (exp.)	44½
33	WAIST	34
25½	THIGH	25
15½	FIST	13
17½	NECK	17½
17½	BICEPS	15
29	AGE	22

Every sport has its own set of statistics for its athletes. Fans often use those statistics to compare the athletes.

1,500 pounds, then the mean weight is 1,500 pounds divided by 100, or 150 pounds. The mean is the most common kind of average.

The mode is simply the number that occurs most often in a sample. If the most common weight in a sample of people is 139 pounds, then the mode is 139. Modes also can describe information not made up of numbers—for example, letter grades.

The median is the number right in the middle of the sample. If the sample weights are 125, 130, 145, 150, and 160 pounds, then the median weight is 145 pounds. Medians are helpful when there are some unusually high or low numbers in the sample.

Using Statistics

Once the data are summarized, people interpret them, or decide what they mean. Newspaper articles, books, and

political speeches often include statistics. People use them to support their opinions.

Because statistics are represented by charts, graphs, and numbers, people tend to believe them. However, people can use statistics to twist the truth. It is important to know whether the statisticians collected the data carefully and summarized them accurately.

Steel

Steel is a hard metal that people use to make many different products. Car bodies, bridges, building frames, and containers are just a few of the things made from steel.

Long sheets of steel are stored on rolls in a factory called a steel mill.

Steel is basically iron mixed with a little carbon. But steel is better than iron in many ways. Steel is stronger but lighter than iron. Steel also lasts longer than iron.

To make steel, workers heat iron until it melts. Then they add carbon to the liquid iron. They may also add other materials to make different types of steel. For example, steel with added chromium is called stainless steel. It will not rust or stain. Finally, workers use machines to cool the liquid steel into bars, slabs, or long sheets. The cooled, hardened steel may then be made into products.

People made the first steel as early as 1400 BC. Ancient people heated iron inside a pile of burning charcoal. This added carbon to the iron. The result was not the same as modern steel, but it was stronger than regular iron.

In the 1800s people began to use huge ovens to make large amounts of steel. In the late 1800s builders used steel to make some of the first skyscrapers. They also used steel to make large, modern bridges. In the 1900s new processes made steelmaking easier. Today steel remains one of the most popular building materials in the world.

Stegosaurus

The name *Stegosaurus* means “covered lizard” or “roof lizard.” The dinosaur called *Stegosaurus* was given this name

*Stegosaurus*

because it had a row of enormous bony plates that ran along its back. *Stegosaurus* is the most familiar and the largest of the stegosaurs, or plated dinosaurs.

When and Where *Stegosaurus* Lived

Stegosaurus lived about 159 to 144 million years ago. Fossils, or remains, of *Stegosaurus* have been found in Colorado, Wyoming, Utah, and Oklahoma. *Stegosaurus* lived in wooded areas with low-growing types of plants.

Physical Features

Stegosaurus was a massive dinosaur that lumbered along on all four legs. It usually grew to a length of about 21 feet (6.5 meters). *Stegosaurus* measured about 10 feet (3 meters) tall at the hips and weighed about 2 tons. The huge plates that ran along its back from its neck to its tail stood in two staggered rows down either side of the backbone. Some of the plates were more than 2 feet (60 centimeters) tall. *Stegosaurus* also had two to

four pairs of spikes on its tail. The body of *Stegosaurus* had an arched appearance. Its back legs were longer than its front legs. *Stegosaurus* had a small, narrow head with a horn-covered beak.

Behavior

Stegosaurus was a plant eater. It used its spiked tail and large plates to defend itself. The plates contained blood vessels that may have helped control its body temperature as well. *Stegosaurus* most likely lived in herds.

Stock Exchange

A stock exchange, or stock market, is a system for buying and selling securities, or stocks and bonds. A stock is a share in the ownership of a company. A bond is an agreement to lend money to a company for a certain amount of time. Companies sell securities to people to

get the money they need to grow. People buy securities as investments, or ways of possibly earning money.

Many countries have one or more stock exchanges. Some important exchanges are the New York Stock Exchange (in the United States), the London Stock Exchange (in England), and the Tokyo Stock Exchange (in Japan). These and other exchanges do much of their business in buildings. NASDAQ, in the United States, is an exchange that does its business electronically, or online.

How a Stock Exchange Works

A number of companies belong to each stock exchange. The companies sell securities to people. People then use the exchange to trade (sell and buy) the securities among themselves. The exchange lists the securities for sale and their prices. It also handles the transfer of securities between sellers and buyers.

The prices of different securities rise or fall, or both, throughout the day, every day the exchange is open. People make

money by selling securities at a higher price than they paid for them.

Rising and Falling Prices

Many factors affect the price of a company's securities. If a company is successful, the price of its stock usually will go up. The health of the economy, laws passed by the government, and wars also can cause securities' prices to rise or fall.

Even people's feelings can affect prices at a stock exchange. For example, if people fear that prices will go down, they may start selling their securities. But if many people sell large numbers of securities, they can actually make prices go down. If widespread selling continues, a stock market crash can happen. A crash means that the prices have fallen so low that very few people are willing to buy securities. As a result, the people who own the securities have little chance of getting their money back.

Crash of 1929

A famous stock market crash happened in the United States in October 1929. Over several days panicked investors sold so many shares of stock that the market collapsed. Almost every part of the economy suffered. Farmers could not sell their crops, banks and businesses closed, and wages fell to very low levels. This period of hardship lasted about 10 years. It became known as the Great Depression.

Stockholm

Population
(2008 estimate)
795,160

Stockholm is the capital of Sweden, a country in northern Europe. It is Sweden's largest city. It is also the country's center of government, culture, education, and business.

Stockholm is known for its natural beauty. It is located where Lake Mälaren meets the Baltic Sea. The city is built on many small islands as well as on the Swedish mainland. Bridges connect the different parts of the city.

The economy of Stockholm is based mostly on industries that provide services and on government. The city is a center for banking, health care, education, and research. Several companies in Stockholm develop technology for computers and wireless communications equipment. Other companies develop technology to make the environment cleaner. Shipping goods through Stockholm's port is also an important industry. Passenger ships use the port, too.

A Swedish ruler named Birger Jarl is said to have founded Stockholm in about 1250. The city grew into an important center of international trade.

Riddar Island is part of the oldest area in Stockholm, Sweden. It is known for its historic sites and architecture.

For many years Denmark and Sweden fought for control of Stockholm. In 1523 Gustav Vasa captured the city for Sweden. Stockholm became the official capital of Sweden in 1634.

Stockholm developed rapidly in the middle of the 1600s. By the 1700s it was a major center of the arts and sciences. In the 1800s many streets, parks, and buildings were constructed in Stockholm. In the late 20th century several new suburbs were created.

Stomach

The stomach is a hollow organ that is a part of the digestive system. Food lands in the stomach after passing down the throat through a tube called the esophagus. The stomach stores food and passes it along in small amounts to the intestines.

The Human Stomach

The human stomach is located in the upper left side of the belly. An adult's stomach is about 10 inches (25 centimeters) long. It can expand to hold as much as 1 quart (0.9 liter) of food.

Glands in the stomach produce gastric juices. These juices partly break down food. A lining of mucus protects the inside of the stomach from the gastric juices.

Stomach muscles mix food and gastric juices together. They also move the food toward the small intestine. Food may remain in the stomach from about one hour to more than five hours, depending on the type of food. Fats remain in the stomach much longer than starches and sugars do. After the stomach empties, the stomach muscles continue to move. This causes hunger pangs.

Stomachs of Other Animals

The stomachs of some animals have more than one chamber, or section. Each chamber has its own job. Cows

The stomach is one of the main organs of the human digestive system. It is connected to the esophagus at one end and the small intestine at the other end.

and other animals that eat grassy food have four separate chambers in their stomachs. Birds have three chambers.

Stone Age

The Stone Age was a time in prehistory when humans made and used stone tools. (Prehistory is the time before people invented writing.) Early humans began using stones as simple tools about 2 million years ago. Humans used mainly stone tools until about 10,000 years ago. However, the Stone Age began and ended at different times in various parts of the world.

Scientists divide the Stone Age into two main periods: the Paleolithic Period and the Neolithic Period. Sometimes scientists put another period, called the Mesolithic, in between these two.

Paleolithic Period

Paleolithic means “old stone age.” At the beginning of the Paleolithic Period, early humans made chopping tools out of stones. These tools did not change much for thousands of years. Then humans learned to chip flakes off stone. With this method they made better tools, such as scrapers and chisels. By about 40,000 years ago humans were attaching stone blades to handles made of bone or antler.

Some Paleolithic people lived in caves. Others lived under rock overhangs or

How Stone Age Humans Made Hand Axes

out in the open. They gathered wild plants to eat. Their tools helped them to hunt animals. Groups moved with the seasons to find food. In the later Paleolithic Period some groups made small sculptures out of clay, stone, or bone. Some groups painted or carved designs on rocks or cave walls.

Neolithic Period

Neolithic means “new stone age.” The Neolithic Period began about 10,000 years ago. During this period people ground and polished stone to make more useful tools. They also learned to grow crops and to tame animals. They began to settle in villages. They learned to make pottery and to weave cloth and baskets.

The Neolithic way of life first appeared in southwestern Asia. Over several thousand years it spread northward to Europe and eastward to India and East Asia. People in the Americas developed Neolithic skills on their own. By about 6500 BC North Americans were growing corn, beans, and squash.

End of the Stone Age

By about 5,000 years ago people in Greece and China were making tools from bronze (a mixture of copper and tin). This development marked the end of the Stone Age and the beginning of the Bronze Age. The Bronze Age began later in other parts of the world. Some places never had a Bronze Age. In the Americas, for example, the development

of agriculture and towns brought an end to the Stone Age.

Stonehenge

Stonehenge is a circular group of huge stone blocks in southern England. It is located near the city of Salisbury in the county of Wiltshire. People built Stonehenge in stages between 5,000 and 3,500 years ago. No one knows for sure why Stonehenge was built. Many scholars think that it was a place of religious worship.

Today only ruins of Stonehenge are still standing. Hundreds of years ago builders took many of the stones for use in other places. Other stones have fallen down. But the ruins still give an idea of what Stonehenge looked like in prehistoric times.

A view from above the ruins of Stonehenge shows the arrangement of its ancient stones. In many ways, Stonehenge is still a mystery to modern scientists and historians.

The largest stones were arranged in two groups. One was a circle of flat stones that rested on other stones that stood upright. The other group was inside the circle. It was a horseshoe-shaped group of five pairs of upright stones, with a flat stone on top of each pair. These stones weighed as much as 50 tons each.

Stonehenge also included smaller stones that weighed up to 4 tons each. Some of these stones had to be moved 240 miles (385 kilometers) from the place where they were mined. No one knows how this was done.

A straight path called the Avenue led away from the circles. An upright stone called the Heel Stone still stands near the center of the Avenue. On the longest day of the year (usually June 21), a person standing in the center of the stone circle can see the sun rise directly above the Heel Stone. This has led some archaeologists (people who study things made by ancient people) to guess that Stonehenge was built by people who worshipped the sun.

Stork

Storks are large birds with long legs, necks, and bills. They are wading birds, which means they typically walk or

stand in shallow water while feeding. There are 17 species, or types, of stork. The most famous type is the white stork. In some European countries it is said to bring good luck. Storks are related to herons, ibises, flamingos, and New World vultures.

Most storks live in warm regions in Africa, Asia, and Europe. They can also be found in the Americas and Australia. The only stork commonly seen in the United States is the wood stork. It breeds in the Southeast and sometimes wanders farther north. Storks tend to live near water, but they can also be found on dry ground. The white stork is known for nesting on rooftops and chimneys in towns.

Storks usually stand about 2 to 5 feet (0.6 to 1.5 meters) tall. The largest stork is the marabou of Africa. Storks commonly have black and white feathers. Some species have no feathers on the head and neck, only red, pink, or black skin.

Most storks eat insects, frogs, fish, and other small animals. They catch their food in fields or shallow waters. The marabou and a type called the adjutant stork feed on carrion, or dead animals.

The stories about storks bringing good luck have led many people to treat the birds well. In some places, however, storks have been hunted and killed for food or for their feathers.

Storm

A storm is a disturbance in the atmosphere, or air. Thunderstorms, tornadoes, and tropical cyclones are powerful and sometimes dangerous types of storms. People also use the word storm to describe strong winds or other forms of severe weather.

Thunderstorms

Thunderstorms include thick clouds, heavy rain or hail, lightning, thunder, and strong winds. Thunderstorms happen when hot, moist air rises quickly to cooler parts of the atmosphere. There the air cools, and clouds and rain form. Lightning, which is a form of electricity, develops inside the clouds. As the lightning heats the air, it causes it to expand. This causes the sound of thunder. Meanwhile, cooled air sinks toward the ground. This movement of air causes heavy winds.

A tornado travels across open land in the U.S. state of New Mexico. Tornadoes can produce the strongest winds found on Earth.

Hailstorms

During a hailstorm balls of ice called hail fall to the ground. Hailstorms often happen during thunderstorms. As rain falls, it pulls air down with it. The downward draft of air may turn upward again. This causes the rain to churn around in the clouds. Some of the rain may freeze to form hail. The hail grows so heavy that it falls to the ground. Pellets of hail are usually 0.2 to 4 inches (5 millimeters to 10 centimeters) across.

Tornadoes

Tornadoes sometimes develop during thunderstorms. A tornado is a column of strongly rotating winds. It may be shaped like a funnel or a pillar. The column reaches down from a cloud to touch the ground. It then moves along the ground at about 28 miles (45 kilometers) an hour. The speed of a tornado's winds may be 300 miles (482 kilometers) an hour. They can destroy buildings and throw heavy objects high into the air.

Cyclones

A cyclone is a large system of winds that blow in a spiral around a central area. Cyclones that form over warm oceans are called tropical cyclones. In the Atlantic Ocean these cyclones are known as hurricanes. In the western Pacific Ocean they are called typhoons. The winds of a tropical cyclone may blow faster than 74 miles (119 kilometers) an hour. The swift winds often bring heavy rain and destruction to coastlines. The center of a tropical cyclone is known as the eye. The weather inside the eye is calm.

Windstorms

Windstorms are dry storms marked by winds with a speed of 73 miles (117 kilometers) an hour or more. Windstorms bring no rain or snow. However, they may pick up large amounts of dust or sand from the ground. During such a windstorm—called a dust storm or a

A woman shovels snow off her car after a blizzard. Severe snowstorms can make getting around by car difficult and often dangerous.

sandstorm—the dust or sand flying through the air can make it difficult to see. Sandstorms are common in deserts.

Snowstorms

Snowstorms feature low temperatures, strong winds, and a lot of snow. Particularly strong snowstorms are called blizzards. A severe blizzard has winds of more than 45 miles (72 kilometers) an hour, visibility near zero, and temperatures of 10° F (–12° C) or lower.

Storytelling

Storytelling has captured the human imagination for thousands of years. People everywhere have told stories to amuse, to teach, to remember, and just to pass the time. People started telling stories long before writing was invented. Today stories are also written down in books of fiction and acted out in movies, television shows, and plays. But people all over the world still tell one another stories out loud. A person who can tell a good story nearly always finds an audience.

The Oral Tradition

Before people developed writing, storytelling was the most important way to pass along information. Anything a culture wanted to preserve—its beliefs, its history, and its traditions—had to be told out loud. Each generation would tell the culture's stories to the next generation. In this way the stories were

Many public libraries and museums invite storytellers to entertain children with their tales.

passed along. Knowledge passed on in this method is called the oral, or spoken, tradition. Even cultures that know how to write still pass along some information in this way.

In some cultures everyone would pass along the stories. In other cultures only special storytellers were entrusted with this important job. A culture's best storytellers had good memories. They could also make the tales very entertaining. This helped ensure that people would listen to their stories and remember them. Sometimes people would sing the stories or tell them in the form of poetry. Melody, rhythm, and rhyme can all make stories easier to remember.

Nevertheless, stories told aloud change over time as different people tell them. A storyteller might change a story on purpose to make it better. Or a teller may simply not remember all of a tale accurately. Unlike written literature, the oral tradition is not created by any one person. Instead an entire culture helps

shape the changing stories across generations. Sometimes the stories are collected and written down long after they have been created.

Types of Stories

Since ancient times stories have taken many different forms. Cultures all over the world tell traditional stories about their gods and beliefs about life. These legends, called myths, are related to religion. Creation myths explain how a culture believes, or once believed, the world began. Other myths may explain how people were created, why it rains, or why there is evil in the world.

Folktales are another form of story common to all cultures. They can be very similar to myths. Folktales take many forms. They may be funny, scary, or tell of exciting adventures. Some folktales tell about strong heroes. Other folktales feature clever “tricksters” who fool other characters. Other tales tell of witches, thieves, ghosts, cowboys, talking animals, or common villagers.

A storyteller sings tales about Australia with a group of students. Singing a story makes it easy to remember as well as fun to tell and listen to.

Fables, fairy tales, and nursery rhymes are common types of folk stories. A fable is a short folktale that teaches a lesson about how people should behave. It usually has animal characters that speak and act like people. Fairy tales tell about magical beings such as fairies, elves, dragons, and trolls. Nursery rhymes tell entertaining stories in short, clever poems. People have told such stories to children for centuries.

Stowe, Harriet Beecher

Harriet Beecher Stowe wrote a famous book called *Uncle Tom's Cabin* about the difficult lives of slaves in the United States. At the time, people argued over whether or not slavery should be allowed. Stowe worked to end slavery.

Harriet Beecher was born on June 14, 1811, in Litchfield, Connecticut. Her father was a preacher who did not believe in slavery. The Beechers moved to Cincinnati, Ohio, in 1832. In Cincinnati, Harriet married Calvin Stowe.

While living in Cincinnati, Stowe learned more about slavery. She found out that her servant was a runaway slave. Stowe and her husband helped the servant escape through the Underground Railroad. This was a secret route that helped runaway slaves escape to Canada.

Harriet Beecher Stowe

from the Southern states. Stowe also started writing articles and stories.

In 1852 Harriet published her most famous book. *Uncle Tom's Cabin* was a book about slave families. It described the horrors slaves faced. Many people say that *Uncle Tom's Cabin* helped bring about the American Civil War. One of the main reasons for the war between the Northern and Southern states was that people did not agree about slavery. Some people in the Northern states wanted slavery to be ended throughout the United States. The Southern states wanted to keep slavery. During the war Stowe met President Abraham Lincoln. He told her that he knew her book had influenced many people.

Harriet Beecher Stowe's career as a writer lasted more than 50 years. By the end of her life, Stowe had written more

than 30 books and many articles. Stowe died in Hartford, Connecticut, in 1896.

Strawberry

Strawberries are red, heart-shaped fruits. They are eaten fresh, often with cream. They are also used as a filling for pastries, pies, and cakes. Strawberries are rich in vitamin C, and they also contain iron and other minerals.

Strawberry plants grow in mild regions all over the world. The United States and Canada are leading producers of strawberries. Many countries have developed their own strawberry varieties to suit their climate.

Strawberry plants grow close to the ground. At the top of the plant is the crown, from which the leaves sprout.

Flowers and strawberries grow on a strawberry plant.

The leaves have three hairy parts with jagged edges. White flowers grow in small groups on slender stalks. As the plant gets older, the crown sends out vines that spread over the ground.

Botanists (people who study plants) do not consider strawberries to be true berries. A true berry, such as a blueberry, is a single fruit that forms from a single flower. Strawberries are actually groups of small fruits that form from a single flower.

Strawberries need to be stored in a cool and dry place after they have been picked. But they still do not stay fresh for very long. Some are frozen or canned to make them last longer.

Strep Throat

Strep throat is an infection of the throat caused by bacteria (germs) called streptococci. Anyone can get strep throat, but the illness is most common in children.

A doctor checks a girl's throat for signs of strep throat.

People develop strep throat between two and five days after coming into contact with the bacteria. The illness usually begins suddenly, with a fever. Other symptoms, or signs, include a severe sore throat, chills, and problems swallowing. There also may be thick white or yellow spots at the back of the throat.

Streptococci live in the nose and throat of an infected person. Sneezing, coughing, sharing dishes, and touching can pass the bacteria to others. Washing hands often may help to prevent the spread of streptococci.

Doctors check for strep throat by swabbing the back of the throat, or wiping it with a special stick. The stick is then tested for the presence of bacteria. Doctors treat strep throat with medicines called antibiotics, which kill bacteria. If strep throat is not treated, it can lead to scarlet fever or a more serious disease called rheumatic fever.

Submarine

A submarine is a vessel, or ship, that can go underwater. Submarines are called subs for short. Militaries and scientists use submarines to travel deep under the ocean.

Militaries use submarines to patrol ocean waters and to attack enemy ships during wartime. Military submarines are usually very large. They may carry more

A nuclear-powered U.S. submarine runs on the surface of the water. The upright structure on the submarine is called the conning tower.

than 100 people. They have separate rooms for working, eating, and sleeping. They also carry such weapons as missiles and torpedoes.

Scientific researchers and explorers usually use smaller submarines. These submarines may have mechanical arms, cameras, and other tools to help scientists study the underwater world.

Parts of a Submarine

A submarine has huge tanks, called ballast tanks, that allow it to dive and to surface. The tanks fill with water to give the submarine the weight it needs to sink. When the submarine is ready to surface, the ballast tanks release the water and fill with air. This lightens the vessel enough for it to float.

For power, submarines use engines, batteries, nuclear power sources, or a combination of these. Propellers push submarines through the water.

A submarine's crew uses complex equipment to find the way through deep, dark oceans. To find enemy submarines or other targets, submarines may use sonar. Sonar equipment locates objects by picking up sound waves. Other onboard equipment provides clean air and fresh water to the crew.

History

A Dutch inventor named Cornelis Drebbel built the first working submarine in 1620. It was a leather-covered rowboat that could reach a depth of 15 feet (4.5 meters).

The U.S. inventor David Bushnell built a submarine that he ran in 1776 during the American Revolution. In 1800 the famous U.S. inventor Robert Fulton built the *Nautilus*. This was a small submarine that could attach explosives to ships.

David Bushnell built a submarine for the United States during the American Revolution (1775–83). The operator ran it by turning a crank that was attached to a propeller.

Other inventors experimented with gas-, steam-, and battery-powered submarines. By the early 1900s submarines had both a diesel engine (a type of internal-combustion engine) and battery-powered electric motors. The diesel engine ran the submarine on the surface. The electric motors ran it underwater. Militaries used these diesel-electric submarines in World War I (1914–18) and World War II (1939–45).

The U.S. Navy introduced the first nuclear-powered submarine in 1954. It was named the USS *Nautilus*. Nuclear submarines need only a small amount of fuel to produce a lot of power. This means that they can stay underwater for an almost unlimited length of time.

Sucre

Population
(2001 census)
193,873

Sucre is one of the two capitals of Bolivia, a country in South America. Sucre is Bolivia's judicial, or legal, capital. The country's Supreme Court meets there. Bolivia's lawmakers and president work in La Paz, the administrative capital.

Cafés line a street in Sucre, Bolivia.

Many people in Sucre work in trade, education, or other service industries. Factories in the city process oil, cement, and foods.

Sucre began as a Charcas Indian village. The Spanish took over the area in the early 1500s. In 1539 the Spanish founded the city of La Plata at the site of the Indian village. The city was also called Charcas or Chuquisaca.

The people of La Plata started a revolt against Spanish rule in 1809. In 1825 Bolivia became an independent country. La Plata became the capital of Bolivia in 1839. The next year it was renamed Sucre after the Bolivian leader Antonio José de Sucre.

In 1898 different groups based in Sucre and La Paz fought for power. They solved their differences by splitting power between the two cities. La Paz became Bolivia's administrative capital. Sucre remained the judicial capital.

Bolivia • La Paz

Sudan

Sudan is the largest country in Africa. It is divided into northern and southern regions. Different groups of people live in the two regions, and this has sometimes led to fighting. The capital of Sudan is Khartoum.

Geography

Sudan covers a large area in northeastern Africa. It shares borders with Eritrea, Ethiopia, Kenya, Uganda, the Democratic Republic of the Congo, the Central African Republic, Chad, Libya, and Egypt. In the east Sudan has a coast along the Red Sea.

Northern Sudan is in the Sahara Desert. Southern and central Sudan have enormous swamps and some mountains. The Nile River flows south to north through the middle of the country. Its two major branches, the White Nile and the Blue Nile, join at the city of Khartoum.

Sudan is a hot country. The north gets almost no rain, while the south has a long rainy season.

Plants and Animals

The northern desert has few plants. Shrubs and grasses grow in central Sudan. Tropical rain forests exist in the far south.

Sudan's wildlife includes lions, leopards, cheetahs, crocodiles, elephants, antelope, giraffes, zebras, chimpanzees, rhinoceroses, and hippopotamuses. These animals live mainly in the south.

People

The name Sudan comes from Arab words meaning "land of the blacks." However, about half of Sudan's people are Arabs. They follow Islam and live mainly in northern and central Sudan. Most of Sudan's black Africans live in the south. They follow Christianity or traditional African religions. Arabic and English are common languages, but Sudan's peoples speak more than 100 other languages. Most people live in the countryside.

Economy

Most of Sudan's people work as farmers. The land between the two branches of the Nile is the country's main growing region. Farmers grow sorghum, millet, sugarcane, peanuts, sesame seeds, cotton, and other crops. They raise sheep, goats, cattle, and camels.

A village sits close to a branch of the Nile River in southern Sudan.

Sudan began selling petroleum (oil) to other countries in 1999. Its factories produce sugar, cement, vegetable oil, shoes, and other goods. Services such as transportation and communications are also important to the economy.

History

People have lived on the land that is now Sudan for tens of thousands of years. In ancient times the northern part of Sudan was known as Nubia. Ancient Egypt sometimes ruled Nubia. From the 1000s BC to the AD 300s Nubia was part of the kingdom of Kush (or Cush).

After Kush lost power, three kingdoms rose up in Sudan. They converted to Christianity in the 500s. These kingdoms reached the height of their power in the 800s and 900s. They collapsed between the 1200s and the 1400s, when Arabs from Egypt moved into northern Sudan.

Egypt conquered all of Sudan in 1874. The Egyptians had British governors

rule the territory. Sudan's Muslims revolted against the British and took control of the region in 1885. The British regained control in 1898. Great Britain and Egypt then ruled Sudan until 1956. That year Sudan became independent.

Military governments, led by Muslims of the north, soon came to power. The non-Muslim peoples of the south fought against the governments. The civil war led to famines and forced millions of people to leave the country. A peace agreement was signed in 2005.

Meanwhile, in 2003, fighting broke out between armed Arab groups called militias and non-Arab Muslims in the region called Darfur, in western Sudan. Sudan's government supported the militias. Tens of thousands of people were killed, and hundreds of thousands were forced from their homes.

Suez Canal

The Suez Canal is a waterway that links the Mediterranean Sea and the Red Sea. It separates the continents of Africa and Asia. It cuts thousands of miles from the routes of ships traveling between Europe and Asia.

The Suez Canal is in Egypt. It extends 101 miles (163 kilometers) through a narrow piece of land called the Isthmus of Suez. Port Said, a city on the Mediterranean Sea, is at the northern end. The port city of Suez is at the southern end. It lies on the Gulf of Suez, a part of the Red Sea. From the Red Sea, ships can reach the Indian Ocean.

Before the Suez Canal was built, ships sailing between the Mediterranean Sea and the Indian Ocean had to sail all the way around the southern tip of Africa. The canal allows ships to pass directly between the Mediterranean and the Indian Ocean. Before the canal, the voyage from London, England, to Mumbai (Bombay), India, was 12,400 miles (19,950 kilometers). The canal shortened the trip to 7,250 miles (11,670 kilometers).

A French-owned company built the Suez Canal between 1859 and 1869. For many years France and Great Britain together owned the canal. They agreed that the canal should be open to ships of all countries in times of both peace and war. But in 1956 Egypt took over the canal. France and Britain, helped by Israel, tried to take back the canal by force. They failed. War between Egypt and Israel closed the canal between 1967 and 1975. Today the canal is one of the world's busiest shipping routes.

Sugar

Sugar is the most widely used sweetener in the world. It makes things such as

The first step in making sugar from sugarcane is to chop the stalks into short lengths.

candy and soda taste good. The sugar most people use is called sucrose.

Sucrose is found in almost all plants. Sugarcane and sugar beets are the best producers of sucrose. Most of the world's sugar comes from them. Sugarcane is a giant, thick grass. Major producers of sugarcane include Brazil, India, and China. The sugar beet is a type of beet. Sugar is stored in its white root. France and Germany are leading producers of sugar beets.

Sugar is made from the juice of these plants. The juice is boiled until it starts to thicken and sugar crystals begin to form. The crystals are then removed. What is left is a syrup called molasses. The sugar crystals go through several more steps, including washing. They are then packaged and sold around the world.

Wet sugar crystals pour out of machinery in a factory. The sugar is ready to be dried, packaged, and shipped to users.

Slight differences in the process can produce other kinds of sugar. For example, a bit of the molasses is left on sugar to create brown sugar.

Doctors tell people to watch how much sugar they eat. Kids who eat lots of sugar may have trouble settling down. This is known as being hyperactive. Too much sugar can cause people to gain weight. It also can lead to tooth decay.

Today some people use artificial sweeteners—such as saccharin and aspartame—instead of sugar. These sweeteners are especially popular with people who are trying to lose weight. However, some doctors think that certain artificial sweeteners are not safe.

Sun

The sun is the star at the center of the solar system. It is a hot ball of gases that gives off great amounts of energy. Life on Earth depends on light and heat from the sun.

The sun is about 93 million miles (150 million kilometers) away from Earth. The next-closest star to Earth is about 250,000 times farther away. That is why the sun is by far the brightest object in the sky.

The sun is the largest object by far in the solar system. Its diameter, or distance through its center, is about 865,000 miles (1,392,000 kilometers). This is

U.S. astronauts took a photograph from space of a huge flare of energy on the sun.

about 109 times bigger than Earth's diameter.

The Sun's "Furnace"

The sun consists mostly of the gases hydrogen and helium. Its core is very hot, probably reaching about 28,080,000° F (15,600,000° C). The hydrogen is packed in tightly at the core. Great pressure squeezes the hydrogen, causing it to change into helium. This process releases huge amounts of energy. Every second the sun changes, or "burns," more than 600 million tons of hydrogen fuel into helium.

The sun has been shining for at least 4 billion years. It is now mostly hydrogen with some helium. Billions of years in the future, the sun will use up all its hydrogen fuel. Eventually it will stop shining.

Surface and Atmosphere

Like the core, the surface of the sun is made of gases. The surface temperature

is about 10,000° F (6,000° C). Sometimes cooler, darker patches called sunspots appear on the surface. Sunspots appear and disappear in 11-year cycles.

Layers of gases, called an atmosphere, surround the sun. Sometimes great blasts of energy, called solar flares, erupt from the inner atmosphere. The outer atmosphere is called the corona. It is very hot, reaching 3,600,000° F (2,000,000° C).

The Solar Wind

The sun's corona shoots out streams of tiny particles that carry an electric charge. These streams are called the solar wind. The solar wind moves through the solar system at about 250 miles (400 kilometers) per second. It can disrupt radio signals on Earth. It also causes colorful bands of light called auroras to appear in the sky in Earth's far north and south.

Sundial

Sundials are the oldest known instruments for telling time. The surface of a sundial has markings for each hour of daylight. As the sun moves across the sky, another part of the sundial casts a shadow on these markings. The position of the shadow shows what time it is.

Before the invention of the clock, many cultures around the world used sundials to tell time.

The flat surface of a sundial is called a dial plate. It may be made of metal, wood, stone, or other materials. Numbered lines on the dial plate, called hour lines, show the hours of the day.

A part called a gnomon sticks up at an angle from the dial plate. The sloping edge of the gnomon is called the style. As the day passes, the gnomon's shadow moves around the dial. Every hour it falls on a new hour line.

The ancient Egyptians made the earliest known sundial in about 3500 BC. This sundial was simply a stick or a pillar that cast a shadow on the ground. The ancient Greeks made a sundial with a bowl-shaped opening cut into a block of

stone or wood. A pointer in the center cast shadows inside the bowl. Muslims later invented the modern sundial—the type with the angled gnomon. Clocks began to replace sundials in the 1300s.

Sunflower

Sunflowers are useful plants with large flower heads, or blooms. They are named for the way they turn their blooms from east to west to follow the sun. Sunflowers were first grown in North and South America. Today they are grown in many parts of the world.

Sunflowers are giants among flowers. The rough, hairy stem grows from 3 to 15 feet (1 to 4.5 meters) tall. The leaves are wide, rough, and 3 to 12 inches (8 to 30 centimeters) long.

The bloom of a sunflower has two parts. The center is a disk of small flowers packed closely together. The disk flowers are brown, yellow, or purple. The flowers around the outside are called ray flowers. They are golden yellow. Some sunflowers have disks that are 12 inches (30 centimeters) wide.

Sunflowers brighten a field in France.

Sunflower plants have many uses. The flowers make a yellow dye. The leaves are used to feed animals. Seeds that come from the disk flowers contain a sweet, yellow oil. Sunflower oil is used in cooking and in making soaps and paints. Many people eat dried or roasted sunflower seeds as a snack.

Sun Yat-sen

Sun Yat-sen helped remove the emperor of China from power in 1912. Sun wanted China to be a strong, modern country with free elections and policies that benefited all citizens.

Early Life

Sun Yat-sen was born on November 12, 1866, in Hsiang-shan, in southern China. For several years he studied with British and U.S. teachers in Honolulu, Hawaii. Later he studied to be a medical doctor in Hong Kong, which was then a British colony. He graduated in 1892.

Revolutionary Leader

Sun soon found a new career. He started working to bring down China's ruling family. Sun thought that China had fallen behind other countries in developing technology. He felt that changing the government was the only way to make China a modern country. In 1895 he took part in an uprising that failed. He then had to leave the country.

Sun Yat-sen

Sun spent the next 16 years living in other countries, including the United States and the United Kingdom. During this time he gathered followers and planned several rebellions. The rebellions failed, but he continued to gain support.

In 1911 the Chinese people finally rose up against the emperor. Sun then returned to China. He became the leader of a new political group called the Nationalist Party. The emperor stepped down on February 12, 1912.

Sun helped establish a new government, but he disagreed with the man who became president. He organized another revolution in 1913, but it failed. He also tried to gain control of the government in 1917 and 1921. Finally, in 1923 Sun made himself the leader of a new Chinese government.

Last Years

Sun worked hard to strengthen the Nationalist Party. He also established a military academy. He died on March 12, 1925. Under the leadership of Chiang

Kai-shek, the Nationalist Party went on to rule China from 1928 to 1949.

Superior, Lake

Lake Superior is the largest, the coldest, and the deepest of the five Great Lakes of North America. It is also one of the world's largest bodies of freshwater. The lake got its name from the French words *lac supérieur*, which mean “upper lake.”

Lake Superior lies between the United States and Canada. It borders the Canadian province of Ontario and the U.S. states of Minnesota, Wisconsin, and Michigan. It spreads over an area of 31,700 square miles (82,100 square kilometers). The Saint Marys River connects Lake Superior with Lake Huron in the east.

Lake Superior has many natural harbors. They include Thunder Bay,

Waves wash up on the rocky shoreline of Lake Superior on the Upper Peninsula of Michigan.

Ontario; Duluth and Two Harbors in Minnesota; and Marquette, Michigan. Huge ships carry minerals, flour, and grain on the lake. They pass through the Sault Sainte Marie canals on the Saint Marys River. Then they travel to other Great Lakes ports or to ports around the world.

Tourism is an important industry in the Lake Superior region. The lake is known for its beautiful shoreline. Hunting and sport fishing are popular activities.

Surgery

Surgery is a medical treatment in which doctors called surgeons use tools to work on a patient's body. Surgery is also known as an operation. Surgeons perform operations for many reasons. They may operate to treat injuries, to remove unhealthy tissue, or to discover the cause of a disease.

Before Surgery

Before performing surgery, the doctors and nurses wash their hands thoroughly. They also put on gowns, caps, gloves, and masks to keep germs away from the patient. They set up machines that will keep track of the patient's breathing and heart rate. They may use drugs to numb the part of the patient's body on which they will operate. Or they may put the patient to sleep with a drug called anes-

Surgeons work in operating rooms that are brightly lit, extremely clean, and stocked with tools and supplies.

thesia. Under anesthesia, the patient feels no pain.

During Surgery

Doctors and nurses may use many different tools during surgery. All these tools must be sterilized, or made free of germs, beforehand. Surgeons commonly use a knife called a scalpel to cut into the body. Special instruments clamp blood vessels to stop the patient from bleeding too much. Sponges absorb some blood, too. Other tools hold the cut tissue open so that the surgeon can work inside the body easily. When finished, doctors usually sew or staple the cut tissue back together.

History

In ancient times people in such places as India, China, Egypt, and Greece performed some types of surgery. During the Middle Ages (about AD 500 to 1500) in Europe, barbers often performed surgery.

Until the 1800s there was no good way to dull the extreme pain of surgery. But in the 1840s surgeons began using ether, an early form of anesthesia. Surgery then became less painful. However, many patients who had surgery still died. Later in the 1800s scientists learned that infections by germs caused many of these deaths. Surgeons began washing their hands and tools to prevent infections during operations. Many more patients then survived surgery.

Did You Know?

Surgeons now use laser beams instead of knives to perform some of their operations.

Suriname

Suriname is the only country in South America that was a colony of The Netherlands. The capital is Paramaribo.

Suriname is on the northern coast of South America. Brazil is to the south. Suriname and its other neighbors, Guyana and French Guiana, disagree about where their borders lie.

The land along the coast is flat and swampy. Hills and mountains cover the rest of the country. Tropical rain forests grow in most of Suriname. Monkeys, sloths, tapirs, deer, jaguars, and parrots live in the country.

The largest groups of people in Suriname are the Hindustanis and the Creoles. The Hindustanis' ancestors came from India. The Creoles have mixed European and African roots. The Javanese, whose ancestors came from Indonesia, are the next-largest group. Maroons (people with African roots),

The Presidential Palace in Paramaribo, Suriname, was built in the 1700s.

American Indians, Chinese, and whites form smaller groups.

Dutch is the national language, but most people mainly speak the language of their group. Christianity, Hinduism, and Islam are common religions.

The economy of Suriname depends on the mining of bauxite (which is used to make aluminum), gold, and oil. Farmers grow rice, sugarcane, bananas, and coconuts. Fishers catch shrimp and fish.

Surinen Indians and other American Indians were the first people in the region. The Dutch took over in 1667. They brought in Africans to work as slaves and, later, Asian workers. Suriname gained independence in 1975. The military took over the government in 1980. Suriname returned to a democratic government in 1991.

Suva

Suva is the capital of Fiji, an island country in the southern Pacific Ocean. Suva is located on the southeastern coast of Viti Levu, Fiji's largest island.

Suva is one of the most modern cities in the South Pacific. The University of the South Pacific is near Suva. Suva also has government buildings and the Fiji Museum, which displays items from the country's history.

Suva's harbor is a regular stop for ships carrying goods across the Pacific Ocean. Sugar and clothing are exported from Suva. The city's other economic activities include tourism and some manufacturing, including soapmaking.

Suva was founded in 1849. In 1874 Great Britain made Fiji a colony. The British made Suva the capital in 1882. In 1970 Fiji became an independent country. Suva remained the capital.

Swamp

Bald cypress trees and azalea bushes grow in the shallow water of a swamp.

A swamp is a type of wetland where trees are common. Swamps are similar to marshes because both have soils that are rich in minerals. Marshes, however, have grasses instead of trees.

Swamps are common in low-lying areas near rivers, which supply the water. Swamps also form on flat land along seacoasts. The soil in a swamp is poorly drained, which means that the water flows through very slowly. The ground becomes soaked. Shallow water often covers the ground.

Swamps may have either freshwater or salt water. The kinds of plants in a swamp depend on the type of water. Bald cypress, gum, willow, alder, maple, and palm trees are common in freshwa-

Swan

Swans are waterbirds with heavy bodies and long necks. They swim gracefully, seeming to glide across the water. They are also strong fliers. Along with ducks and geese, swans belong to a family of birds called waterfowl in North America and wildfowl in Europe. Swans are the largest and the least common of the waterfowl.

Swans are found on or near water. Most types migrate, or fly long distances to spend different seasons in different regions.

Baby swans, called cygnets, ride on the back of an adult mute swan.

Five species, or types, of swan live in the northern parts of Europe, Asia, or North America. These are the mute swan, the trumpeter swan, the whooper swan, Bewick's swan, and the whistling or tundra swan. All five northern species are white.

Three species of swan are found in southern regions. The black swan lives in Australia. Two types are found in southern South America: the black-necked swan and the coscoroba.

Swans are among the larger flying birds. The trumpeter swan is the largest waterfowl. It can reach 5.5 feet (1.7 meters) in length. The mute swan is also very large and heavy.

Like the other waterfowl, swans have webbed feet. This gives them extra paddling power in the water. Waterfowl also have a gland that makes oil. The oil helps protect their feathers from water. An inner layer of soft feathers called down helps the birds stay warm.

Swans use their long necks to pluck plants from below the surface of the water. They also eat seeds, small water creatures, and fish eggs.

Swans mate with the same partner each year. The female lays about six eggs at a time. The young of white swans usually have darker feathers than their parents.

Swaziland

The small kingdom of Swaziland is one of the few countries in Africa with a ruling king. Swaziland has two main capitals, Mbabane and Lobamba.

Swaziland is almost surrounded by South Africa. On the east it has a short border with Mozambique. The land slopes down from highlands in the west to lowlands in the east. Mountains rise sharply in the far east.

Grasses and scattered shrubs cover most of Swaziland. Pine and eucalyptus trees grow in the west.

Antelopes, hippopotamuses, rhinoceroses, elephants, giraffes, and zebras live mainly in protected parks. Swaziland's other animals include monkeys, jackals, mongooses, crocodiles, and snakes.

The Swazi are the main people in Swaziland. The Zulu and the Tsonga form smaller groups. English and Swazi are

Girls from all over Swaziland take part in a ceremony called the reed dance.

the main languages. Most of the population is Christian. Most people live in the countryside.

Many people work as farmers. Crops include sugarcane, corn, and cotton. Cattle and goats are the main livestock. Swaziland's industries make soft drinks, clothing, wood pulp, and metal products. Mines provide coal. Tourism and other services are also important to the economy.

The Swazi people did not set up a kingdom until the 1800s. The Swazi king soon asked the British in South Africa to help defend the kingdom against the Zulu people. Great Britain took control of Swaziland in the early 1900s.

Swaziland gained independence in 1968. A Swazi king ruled the country into the 21st century.

Sweden

The Kingdom of Sweden is a large country in northern Europe. During the 1600s Sweden was one of the most powerful countries in Europe. Today Sweden is a peaceful, wealthy country. The capital is Stockholm.

Geography

Sweden is the largest country in Scandinavia, a region that also includes Norway and Denmark. Norway lies along Sweden's long western border. Sweden shares a shorter border with Finland in the northeast. The Gulf of Bothnia and the Baltic Sea lie off Sweden's east coast. Narrow bodies of water separate Sweden from Denmark to the southwest.

A long range of mountains runs along the western border of Sweden. In the east there are low plains. Many small rivers start in the mountains and run toward the southeast. Lakes dot the land.

A castle is reflected in a water garden in Kristianstad, Sweden.

Sweden generally has a mild climate with cool summers and cold winters. However, northern Sweden has very cold, dark winters. In the north it can snow for eight months a year. North of the Arctic Circle, the sun hardly rises during the winter.

Plants and Animals

Forests of fir, pine, and birch trees cover much of the land. Many berries and mushrooms grow in the forests.

Animals in the forests include hares, weasels, squirrels, foxes, elk, and bears. The Sami people (or Lapps) raise herds of reindeer in the far north. Moose and lynx also live in the north. Many fish swim in Sweden's lakes, rivers, and seas.

People

Most of the people of Sweden are Swedes. Finns, Serbs, other Europeans, and some Asians and Africans form smaller groups. There are also several thousand Sami in Sweden. The Sami live in far northern Scandinavia.

Swedish is the country's main language. Most people belong to the Church of Sweden, a branch of Lutheran Christianity. Most of the people live in cities, mainly in the south.

Economy

Services, including banking, health care, and communications, are key parts of Sweden's economy. Manufacturing is also important. Two of Sweden's major companies, Saab and Volvo, make cars. Sweden also produces machinery, electronics, paper, metals, food products, and furniture. Mines provide iron, zinc, copper, and other minerals. The country's forests provide wood.

Agriculture is a small part of the economy. Farmers grow mainly sugar beets, wheat, and barley. Pigs, cattle, and sheep provide meat and dairy products. Fishing is another source of food.

A railway station lies nestled in the snow in a small town in northern Sweden.

History

Humans have lived in what is now Sweden for thousands of years. The Sami were some of the earliest people in the region.

Warriors known as Vikings lived in Sweden and most of Scandinavia beginning in the 800s. For the next 200 years the Swedish Vikings attacked lands across northeastern Europe and into Russia.

In the Middle Ages Sweden was divided into a number of provinces, each with its own laws. Powerful local kings struggled for control of Sweden. The provinces joined together to create a unified kingdom by the 1200s. Sweden took over Finland in 1323.

A Troubled Union

In 1397 a single king gained power over Sweden, Norway, and Denmark. The three kingdoms stayed together for about 125 years. But there were many conflicts between Sweden and the other kingdoms. One of the worst battles hap-

TIMELINE

Sweden becomes a united kingdom.

Sweden leaves the union.

Sweden takes Norway from Denmark.

Sweden takes power away from its king through a new constitution.

1100s	1397	1523	1611	1814	1905	1975
	Sweden, Denmark, and Norway form a union.		Gustav II Adolf becomes king of Sweden.		Sweden gives Norway independence.	

pened in 1520. Danish armies invaded Sweden and killed many people in an event called the Stockholm Bloodbath. Sweden broke away from the union in 1523.

A Great Power

In the 1600s Sweden became a great power, led by King Gustav II Adolf. Sweden conquered large parts of the neighboring countries of Finland, Estonia, Russia, and Poland. Gustav died in battle in 1632. Nevertheless, Sweden remained the most powerful country in northern Europe for nearly another 100 years.

In the 1700s and early 1800s Sweden fought a number of wars against Russia. Sweden lost a great deal of land, including Finland, to Russia. However, Sweden later joined with Russia and Great Britain in a war against France. Sweden also took Norway from Denmark in 1814. Sweden ruled Norway until 1905.

Modern Sweden

In modern times Sweden has worked to stay neutral—meaning that it does not take sides in conflicts between other countries. Sweden did not fight in either of the world wars of the 20th century.

In the second half of the 20th century Sweden became one of the richest countries in Europe. The Swedish people also paid some of the highest taxes in the world. The government used the tax money to provide many social services, including free education and health insurance for all Swedes.

In 1975 Sweden took away the last powers of its king. A prime minister then led the government. In 1995 Sweden joined the European Union (EU), a group of democratic countries. However, in 2003 Sweden voted against using the euro, the EU's form of money.

Sweet Potato

Sweet potatoes are not related to potatoes. They are the large roots of a separate plant.

The sweet potato is an important food source. It is very nutritious and high in vitamin A. The sweet potato grows in most warm, moist climates. Its scientific name is *Ipomoea batatas*. The sweet potato is not related to yams or potatoes.

The sweet potato plant is a climbing vine. Funnel-shaped flowers grow in clusters on the vines. The flowers are shaded with pink or rose violet.

The root of the sweet potato plant is the part that is eaten. Each plant produces 4 to 10 of these roots. They are usually oval with pointed ends. The skin of a sweet potato ranges in color from tan to brown to purplish red. The inside can be white, orange, or even purple.

People eat sweet potatoes boiled, baked, or fried. They can be used as a side dish or as a filling for pies. The leaves of the sweet potato plant also can be eaten. Both the root and the vines are used as food for animals, too.

Swimming

Swimming is a popular exercise and sport. As exercise, swimming provides all-around conditioning for both young and old. As a sport, swimming includes races that are held at athletic clubs, schools, and national and international competitions. Swimming is a major part of the Summer Olympic Games.

Swimming moves a person's body through water. Unlike many animals, humans are not able to swim at birth. A person must learn how to swim. A beginning swimmer learns how to repeat a series of arm and leg movements. These movements are called swimming strokes.

Swimming Strokes

Swimming strokes provide the power to move a swimmer through the water. There are five major swimming strokes: freestyle (or crawl), breaststroke, butterfly stroke, backstroke, and sidestroke.

Freestyle swimming is noted for its speed. A freestyle swimmer's arms alternate, or take turns, in creating the power stroke. In the breaststroke, both arms perform a power stroke at the same time. Then both legs perform a power stroke called the frog kick. In the butterfly, the arm movements look something like the flapping of a butterfly's wings. The backstroke is similar to the freestyle. However, it is performed with the back to the water instead of face down. In the sidestroke, the swimmer lies on either side.

Sport Swimming

A swimming contest is called a meet. Meets are held in large pools marked with swimming lanes to guide the swimmers. The most important international meet occurs every four years at the Olympic Games.

The four strokes used in the Olympics and other international competitions are freestyle, breaststroke, butterfly, and backstroke. There are races for individual swimmers and for teams of four. The team events are called relays. In most races the swimmers use only one

stroke. However, all four strokes are used in events called medley races. The races cover distances ranging from 50 to 1,500 meters (164 to 4,921 feet).

Races longer than 1,500 meters are called long-distance swimming. Long-distance races usually take place in lakes or other natural bodies of water.

One of the most famous distance swims took place in 1875. In that year Matthew Webb of Great Britain became the first person to swim across the English Channel. The channel is the part of the

Atlantic Ocean that separates Great Britain from France. In 1926 Gertrude Ederle of the United States became the first woman to swim the channel.

History

The Egyptians practiced swimming as early as 2500 BC. In ancient Greece and Rome young males learned to swim as part of their schooling. In ancient Japan swimming races were held in the 1st century BC.

Swimming contests first became popular in the 1800s. The first swimming cham-

pionship was held in Australia in 1846. In England a meeting of swimming clubs in 1869 led to the creation of the Amateur Swimming Association. It became Great Britain's governing body of sport swimming. The Amateur Athletic Union, founded in 1888, governs swimming in the United States. In 1896 the first modern Olympic Games included swimming events. The popularity of the Olympics helped the sport to grow.

Switzerland

The country of Switzerland is in the heart of Europe's highest mountain range, the Alps. The country is known for its long tradition of staying neutral, or not taking sides, in wars. The capital is Bern.

Geography

Switzerland is in central Europe. It shares borders with France, Germany, Liechtenstein, Austria, and Italy.

Mountains cover more than half of the country's land. The Swiss Alps are in the central and southern parts of the country. The Jura Mountains run along the western border with France. A hilly region lies between the Alps and the Jura Mountains.

Many important rivers, including the Rhine and the Rhône, begin in the Swiss mountains. The largest lakes in Switzer-

A small village in Switzerland sits in a valley near the Swiss Alps. Much of the country is mountainous.

land are Lake Constance in the northeast and Lake Geneva in the southwest.

Fog often covers the country's lower lands. The Swiss mountains receive more rain and snow than the valleys. About 10,000 avalanches happen each year in the mountains.

Plants and Animals

Leafy trees and evergreens grow in the lower areas. Shrubs, mosses, and lichens grow in the higher regions. Grasses cover much of the central hills.

Small, goatlike antelope called chamois live high in the Alps. In the forests there are deer, rabbits, foxes, badgers, and squirrels.

People

Swiss people who speak German make up most of the population. Swiss who

speak French or Italian also form large groups. A smaller group of people in the east speak an ancient language called Romansh. There are also small groups of Slavs, Portuguese, Spanish, and others.

Most Swiss are Christians. There are slightly more Roman Catholics than Protestants. More than two thirds of the population lives in cities.

Economy

Switzerland is one of the richest countries in the world. The economy is based on services and manufacturing. Tourism and banking are important service industries. Swiss banks are famous for their policy of strict privacy. This has allowed them to attract customers from around the world. Manufacturers make machinery, chemicals, clocks, watches, food products, and other goods. Switzerland has few natural resources, so most raw materials needed for industry must be bought from other countries.

Swiss farmers grow sugar beets, wheat, barley, potatoes, apples, and grapes. They also raise cattle and pigs. Switzerland is known for its dairy products and chocolates.

History

More than 2,000 years ago a Celtic people known as the Helvetii lived in western Switzerland. The ancient Rhacians controlled the east. After 58 BC the region was a part of the Roman Empire. From the AD 200s through the 500s Germanic tribes invaded.

Hapsburg Rule

During the 1000s the Hapsburg family of Austria gained power over Switzerland. In 1291 some small Swiss communities, called cantons, joined forces against the Hapsburgs. They formed a union known as the Swiss Confederation. More cantons joined later. (Today Switzerland has 26 cantons.)

During the 1500s Switzerland was a center of the Reformation. The Reformation began as an effort to change some practices of the Roman Catholic church. It turned into a revolution that split the Christians of western Europe into Protestants and Catholics. Protestants battled Roman Catholics in parts of Switzerland.

A Neutral Country

Switzerland gained independence from the Hapsburgs in 1648. France invaded Switzerland in 1798. In 1815 Switzerland regained its independence. It also became a neutral country. This meant that the Swiss would not choose sides during international conflicts.

Switzerland was neutral during World War I (1914–18) and World War II (1939–45). After the wars Switzerland did not join international organizations such as the United Nations (UN) and the European Union. Nevertheless, the country kept strong ties with the rest of Europe. In 2002 Switzerland finally joined the UN.

Swordfish

The swordfish is a fish that was named for its long, thin snout. The swordlike snout is flat rather than rounded. For this reason, the fish is sometimes called the broadbill. The swordfish's scientific name is *Xiphias gladius*.

Swordfish are found in oceans around the world. They are mainly pelagic. This means that they live out in the open sea.

Swordfish grow to about 15 feet (4.6 meters) long. They can weigh as much as 1,000 pounds (450 kilograms). Swordfish are purplish blue in color. The sword is almost black. Unlike most fishes, the adult swordfish does not have scales. It also does not have teeth.

The swordfish has a powerful body that is shaped like a torpedo. Its sword is actually a bony extension of the top jaw. The swordfish eats smaller fishes and squid. It uses its sword to slash through schools of fishes.

Swordfish reproduce by laying eggs. The young swordfish hatch after about two

and a half days. They have teeth and scales but not a sword-shaped snout. By the time a swordfish is about 2 to 4 feet (0.6 to 1.2 meters) long, it has lost its teeth and scales. It also has grown a sword.

Swordfish are important to the fishing industry. They are also popular with people who fish for sport. When caught, a swordfish will use its sword to defend itself.

Sydney

Population
(2006
estimate), urban
area,
4,293,100

Sydney is a major city in Australia, a country in Oceania. The greater Sydney area is Australia's largest metropolitan area. Sydney has a huge and magnificent harbor. It is one of the most important ports on the South Pacific Ocean. The city is also one of Australia's main centers of business and culture.

Places of Interest

The Sydney metropolitan area stretches across a large section of land. The city center lies along the harbor. The Sydney Harbour Bridge is one of the longest in the world of its kind. The city's most famous landmark, the Opera House, is

A swordfish swims in the Pacific Ocean near Costa Rica.

The Sydney Opera House is a distinctive feature along the city's waterfront.

also on the waterfront. It has several white roofs shaped like shells. Sydney is also home to a large aquarium.

Many beaches and parks surround Sydney. The city is famous as a place for sailing, swimming, surfing, and other sports and recreation.

Economy

Sydney is Australia's main center of banking and business, especially computer and communications services. Tourism, education, entertainment, and trade are also important. Many large companies have headquarters in Sydney. Manufacturing is a smaller part of the city's economy.

History

The people called Aborigines have lived in Australia for many thousands of years. The British began settling in Australia in 1770. Great Britain's rulers decided to use the island as a prison colony, where they could send convicts to serve their sentences. Sydney was founded as a prison colony in 1788.

Sydney soon became a major trading center. It continued to be a home for British convicts until 1840. The city grew rapidly in the late 1800s. By 1930 more than 1 million people lived in the metropolitan area. Sydney and its economy continued to grow throughout the 1900s. Sydney hosted the Summer Olympic Games in 2000.

Australia

Symbiosis

Symbiosis is a close relationship between two different kinds of organisms, or living things. There are three basic types of symbiotic relationships: mutualism, commensalism, and parasitism.

Mutualism is a relationship in which both organisms benefit. For example, bacteria live in the digestive system of cows. The bacteria help the cows by breaking down plants that the cows eat. In turn, the cows provide a place to live and a source of food for the bacteria.

Remora fish have a symbiotic relationship with sharks and other larger sea animals.

Commensalism is a relationship in which one organism benefits but the other is neither helped nor harmed. Remora fish and sharks have a commensal relationship. Remora fish attach themselves to sharks. The fish eat scraps left over by the sharks. But the fish do not affect the sharks.

Parasitism is a relationship in which one organism benefits but the other is harmed. The organism that benefits is known as a parasite. Parasites live on organisms known as hosts. Hosts are usually larger than their parasites. Ticks and fleas are examples of parasites. They attach themselves to a dog, a cat, or another host and feed off its blood. This can cause itching, pain, or even disease in the host.

Synagogue

A synagogue is a place of worship for people of the Jewish religion. Jews also use synagogues as places to meet and study. Synagogues have played an important role in preserving the Jewish religion and culture throughout history. A synagogue is sometimes called a temple or a shul. (Shul is a word in the Jewish language called Yiddish.)

The layout and design of synagogues can vary greatly. Older synagogues were often built in small streets near a marketplace, in a courtyard, or on the top floor of a building.

A cabinet called the ark is a part of every synagogue. But many other features vary from place to place. A synagogue in Uzbekistan features central Asian carpets.

The most important thing inside a synagogue is the ark, or cabinet, that holds the Torah scrolls. The Torah is a holy book of Judaism. There is also a platform called a bimah, where a reader reads the Torah to the worshippers. There may be a stand where the rabbi, or leader of the synagogue, talks to the worshippers as well.

Worshippers sit in long rows of seats called pews. In the past, most synagogues had separate places for men and women to sit. In the branch of Judaism called Orthodox, men and women still sit separately in the synagogue.

The main part of synagogue worship is the reading of the Torah. Worship services usually take place on Friday nights and Saturday mornings and on holy days and festivals.

Syria

Syria is a country in the Middle East. The capital is Damascus, one of the oldest cities in the world.

Geography

Syria lies on the eastern end of the Mediterranean Sea. Syria shares borders with Turkey, Iraq, Jordan, Israel, and Lebanon. Syria and Israel do not agree on the location of their border.

A narrow plain runs along Syria's western coast. Mountains lie east of the plain and in the southwest. The highest point in Syria is Mount Hermon. It is 9,232 feet (2,814 meters) tall. East of the mountains is the Syrian Desert. Rock and gravel, not sand, cover the desert. Syria has two major rivers: the Orontes and the Euphrates.

Most of Syria has a dry climate with cold winters and very hot summers. The coast receives more rain and has milder temperatures.

Plants and Animals

There are some forests of yew, lime, pine, and fir trees in Syria's mountains. Date palms grow near the Euphrates River. The Syrian Desert does not have many plants.

Syria is home to deer, bears, squirrels, wolves, hyenas, and foxes. Animals in the desert include snakes, lizards, gazelles, and jumping rodents called jerboas.

People

Arabs make up most of Syria's population. A small group of Syria's Arabs are Bedouins, people who herd animals in the deserts of the Middle East. After Arabs, the next largest group is the Kurds. Small groups of Armenians, Turks, and others also live in Syria. Arabic is the main language. Most people live near the coast or in the Euphrates River valley.

Most Syrians practice Islam. Christians make up a small part of the population. A small number of Syrians follow Druze, a religion that combines Islam, Christianity, Judaism, and other faiths.

Economy

The government controls the economy in Syria. The largest sections of the economy are agriculture, mining, and manufacturing. Farmers grow wheat, sugar beets, cotton, olives, grapes, and

Two Syrian men sell bunches of dates.

other crops. Many people raise sheep, goats, and cattle. Syria's mines provide asphalt, salt, marble, and phosphates, which are used to make fertilizer. Manufacturers make cloth, cement, cooking oil, and other goods. Petroleum (oil) is the main product that Syria sells to other countries.

History

Humans have lived in what is now Syria for more than 4,500 years. Some of the earliest peoples wrote on clay tablets that still exist. The tablets tell about life in Syria at that time. Many other peoples—including Egyptians, Hittites, and Assyrians—invaded Syria in its early history. Syria later was controlled by the Babylonian, Persian, and Greek empires. In 64 BC the Romans conquered Syria.

Muslim Empires

In the AD 600s Muslim Arab armies invaded Syria. Muslim empires ruled Syria for most of the next 1,300 years. However, Christian Crusaders controlled some areas between about 1100 and 1300. The last of the Muslim

empires to rule Syria was the Ottoman Empire. It took control in 1516.

Independence

The Ottoman Empire lost power after World War I (1914–18). In 1920 France gained control of Syria. Syria won independence from France in 1946. Military leaders then ruled the country.

In 1948 part of the land to the south of Syria became the country of Israel. Syria and other Arab countries soon fought several wars with Israel. In 1967 Israel took a piece of land called the Golan Heights from Syria.

In the 1970s Syria sent soldiers into Lebanon during a civil war there. Syrian forces stayed in Lebanon until early 2005. In 1991 Syria fought against Iraq in the Persian Gulf War.

Taft, William Howard

William Howard Taft was the 27th president of the United States.

William Howard Taft was president of the United States from 1909 to 1913. He later served as chief justice of the U.S. Supreme Court. He is the only person to have held the country's two highest offices.

Early Life

William Howard Taft was born into a wealthy family on September 15, 1857, in Cincinnati, Ohio. His parents were Alphonso Taft and Louisa Maria Torrey. His father was secretary of war and attorney general under President Ulysses S. Grant.

Taft graduated from Yale University in 1878 and Cincinnati Law School in 1880. He married Helen (Nellie) Heron in 1886. They had three children.

In 1887 Taft became a judge of the superior court of Ohio. He was named a judge of a U.S. circuit court in 1892.

Political Career

In 1900 President William McKinley asked Taft to organize a government for the Philippines. The country had come under U.S. control after the Spanish-American War of 1898. In 1901 Taft became governor of the Philippines. Taft returned home in 1904 to serve as secre-

Taft resigns from the Court.

tary of war under President Theodore Roosevelt.

Presidency

Roosevelt supported Taft in the presidential election of 1908. He believed that Taft would continue his reforms. A Republican, Taft defeated the Democrat William Jennings Bryan to become president.

As president, Taft failed to solve the growing split between conservative and progressive Republicans. The progressives wanted Taft to continue Roosevelt's reforms. Taft did continue to attack the big business groups known as trusts. However, Taft disappointed progressives by approving a high tariff, or tax on imports. He also refused to hire progressives as his advisers.

Roosevelt and the progressives soon left the Republican Party to form the Progressive Party. In the 1912 presidential election the Republican Taft ran against the Progressive Roosevelt and the Democrat Woodrow Wilson. The split in the Republican Party allowed Wilson to win the election.

Later Years

After leaving office Taft taught law at Yale University. In 1921 President Warren G. Harding appointed Taft chief justice of the U.S. Supreme Court. Taft was happier in this post than he was as president. He helped the Court to work faster and to focus on the most important national cases.

Suffering from heart disease, Taft resigned on February 3, 1930. He died on March 8 in Washington, D.C.

Taiga

The taiga is one of the major biomes of the world. Biomes are regions with similar climates and plants and animals. The main feature of the taiga is its conifer forests. Conifers are trees that form seeds inside cones. The taiga grows across the northern parts of Europe, Asia, and North America. Another name for taiga is boreal forest.

Features

In addition to its forests the taiga is known for its long, cold, snowy winters and short, cool summers. It lies just south of the cold, treeless area called the tundra. Where the two regions meet, there are few trees. The forests are

Shallow ponds and cone-bearing trees are common sights in the taiga.

thicker in the southern taiga. Many lakes and bogs are found in the taiga.

Life in the Taiga

The main trees of the taiga are conifers with needle-shaped leaves. In the south, trees with broad leaves—for example, alders, aspens, and birches—grow among the conifers. Mosses, liverworts, and lichens grow on tree trunks, rocks, and the ground.

The conifers in the taiga have features that help them to survive in the cold, snowy climate. Their branches point downward. This helps snow to slide off easily and keeps the branches from breaking off. In addition, conifers are a dark green color. This means they have more of the substance that allows green plants to soak in sunlight. They need to absorb as much sunlight as possible during the short summer.

Mammals in the taiga include lynx, wolves, moose, reindeer, beavers, shrews, voles, squirrels, and martens. Many birds come to the taiga in summer. Only a few types, including ravens and chickadees, stay through the long winter.

Resources

People cut down many of the trees of the taiga for wood. The earth under certain areas of the taiga is rich in petroleum (oil), natural gas, and coal. However, logging, oil drilling, and mining have harmed the environment in many parts of the taiga.

Tail

A young opossum hangs from a branch by its tail.

Many animals have a tail, which is a body part that extends from the hind-quarters, or rear of the body. In animals that have a backbone, the tail is an extension of the backbone. This type of tail contains bones. In animals without a backbone, the tail does not contain bones.

The tails of most animals have one or more uses. Tails help many animals to move. Some types of monkeys use their tail to grab branches as they swing through the trees. A squirrel uses its tail to balance and steer as it leaps through the air. The tip of a mole's tail is very sensitive. This helps it to move backward through tunnels quickly. The tails of lobsters, fishes, and whales push them through water.

Some animals use their tails as weapons. Crocodiles and alligators swing their

Did You Know?

Taipei

Population
(2008
estimate), city,
2,629,270;
urban area,
6,698,320

Taipei is the capital of Taiwan, an island off the southeast coast of China. Taiwan is a province of China. However, Taiwan elects its own government to rule the island. Taipei is Taiwan's largest city. It is also the island's center of business, industry, and culture.

The 2-28 Peace Park is a popular place to visit in Taipei, Taiwan. It was named to honor a group of people who made a protest against their government on February 28, 1947.

Service industries such as banking, trade, and transportation are important to Taipei's economy. Many businesses in the city involve computers or other high-technology goods and services. Factories in Taipei make such products as electronics, software, cloth, and chemicals.

People from the Chinese mainland founded Taipei in the early 1700s. In 1886 China made Taiwan a province with Taipei as its capital. Japan ruled the island from 1895 to 1945. Taipei remained the capital during that period.

The Nationalist political party controlled mainland China in the early 1900s. In 1949 Chinese Communists took over the mainland. The Nationalists fled to Taiwan. They made Taipei their capital. The Nationalists and the Communists each claimed to be the true

government of China. However, in 1971 the United Nations began treating the Communist mainland government as the only government of China.

Taipei grew greatly in the late 20th century. Many people now live in a relatively small city area.

Taiwan

Taiwan is a small island off the southeast coast of China. Taiwan is a province of China, not an independent country. However, Taiwan's government has the power to rule the island. Taiwan also calls itself the Republic of China. The capital is Taipei.

Geography

Taiwan lies in the Pacific Ocean about 100 miles (160 kilometers) from mainland China. The Philippines is to the south. Japan lies to the northeast.

Mountains and hills cover the eastern two thirds of Taiwan. Low plains make up the western third of the island. The weather is warm and humid. Severe storms called typhoons often strike the island during the summer.

Plants and Animals

Thick forests cover much of Taiwan.

Cypress, cedar, juniper, maple, and pine trees grow in the mountains. Palm trees, bamboo shoots, and tropical evergreens grow in the lowlands.

Taiwan's animals include foxes, deer, wild boars, monkeys, and goats. The native Formosan black bear lives only in the mountains.

People

Nearly all the people in Taiwan are Chinese. Most of the Chinese have roots in southeastern China. They are often called the Taiwanese. A smaller group of Chinese came to Taiwan in 1949. Their descendants are called "mainlanders." The original people of Taiwan form only a tiny group. They live mostly in the mountains.

Mandarin Chinese is the main language. Taiwan's major religions are Buddhism and Daoism. Most people also follow traditional Chinese religions. Most of the population lives in cities and towns in the west.

Economy

Taiwan has a strong economy based on manufacturing and services such as banking. Factories make electronics,

A huge statue of the Buddha overlooks many other Buddha sculptures at a religious center in Taiwan. Many people in Taiwan practice Buddhism. Buddhism is a religion based on the teachings of the Buddha.

cement, iron and steel, cloth, chemicals, cars, and other goods.

Farmers in Taiwan grow rice, sugarcane, citrus fruits, bananas, and other crops. Fish, pigs, and chickens are other sources of food.

History

People from other Pacific islands and Asia first came to Taiwan between 12,000 and 15,000 years ago. Portuguese sailors arrived in 1590 and gave the island the name of Formosa. Dutch traders later took control of the island.

Chinese and Japanese Rule

In 1661 armies for the Ming Dynasty, or royal family, of China pushed out the Dutch. The Qing Dynasty of China

took over in 1683. The Qing Dynasty ruled Taiwan for the next two centuries. Many Chinese people settled in Taiwan during this time.

In 1894–95 Japan and China fought each other in the Sino-Japanese War. At the end of the war, Japan took control of Taiwan. During World War II (1939–45) the Japanese used Taiwan as a military base. Taiwan returned to China's control in 1945.

Nationalist Government

In the late 1940s two groups, the Communists and the Nationalists, fought for control of China. In 1949 the Communists won. The Nationalists fled to Taiwan and set up their government there. Both the Communists and the Nationalists claimed to be the true government of all of China.

The United Nations (UN) treated Taiwan's government as the government of China until 1971. That year the UN accepted the mainland Communist government as the only Chinese government.

Taiwan Today

Taiwan held its first free elections in the 1990s. The Nationalists lost control of the government in 2000. A party called the Democratic Progressives took power. Meanwhile, some people began calling for complete independence from China.

Many rugged, snow-covered peaks lie in the Pamir Mountains of Tajikistan.

Economy

Tajikistan is a poor country. Most people are farmers. The main crops are cotton, potatoes, wheat, tomatoes, and grapes. People also raise sheep, goats, and cattle. Tajikistan's factories produce aluminum, cloth, electricity, food products, machinery, and chemicals.

History

The Tajiks lived in the area by about 2,500 years ago. They set up states along the Silk Road, a trade route to China.

In the AD 600s and 700s Muslim Arabs conquered the area. Beginning in 999, many other groups ruled the land for hundreds of years.

Russia took control in the 1800s. In the 1920s Tajikistan became part of the Soviet Union. Tajikistan gained independence in 1991.

Taj Mahal

The Taj Mahal is considered one of the most beautiful buildings in the world. It is located in the city of Agra in northern India. A ruler named Shah Jahan had the Taj Mahal built as a monument and tomb for his beloved wife, Mumtaz Mahal.

Shah Jahan was the Muslim ruler of the Mughal Empire in India from 1628 to 1658. His wife died in 1631, and the construction of the Taj Mahal began the following year.

The monument is located on the bank of the Yamuna (or Jumna) River. It is surrounded by formal gardens and reflecting ponds. The building rests on a square marble base that rises 23 feet (7 meters) high. The building is roughly square-shaped. Each of the four faces of the structure has a large arch that rises 108 feet (33 meters) high. Above the center of the building is an onion-shaped dome.

Pure white marble covers the outside of the building. Set into the marble are gemstones of various colors. These include lapis lazuli, jade, crystal, turquoise, and amethyst. The stones form geometric and floral designs.

The interior of the Taj Mahal is a large room that contains monuments to Jahan and his wife. A carved marble screen surrounds these monuments. Beneath the monuments lie the actual tombs of Jahan and his wife.

White marble and gemstones cover the outside of the Taj Mahal. Some 20,000 people worked on the monument, which took 22 years to build.

Over the years the Taj Mahal has been affected by pollution from nearby factories as well as from motor vehicles. However, steps are being taken to prevent further damage to the site.

Tallahassee

Population
(2000 census)
150,624;
(2007 estimate)
168,979

Tallahassee is the capital of the U.S. state of Florida. The city lies on a series of rolling hills.

care or education. The city is home to Florida State University and other schools of higher learning. Tallahassee is also the trade center for crops and dairy products produced on nearby farms. Factories in the city make electronics and other products.

Tallahassee was originally an Apalachee Indian village. The village was already established by the time the Spanish explorer Hernando de Soto visited the area in 1539. Creek Indians later moved to Tallahassee. The U.S. government forced the Indians to leave the area in the early 1800s. In 1824 Tallahassee became the capital of the Florida Territory. Florida became a U.S. state in 1845. Tallahassee then became the state capital.

Tallchief, Maria

Maria Tallchief was one of the greatest U.S. ballerinas. She danced with the

New York City Ballet for 18 years. There she performed many dances created by George Balanchine, an important ballet director.

Tallchief was born on January 24, 1925, in Fairfax, Oklahoma, a town on an Osage Indian reservation. Her father was Osage. She began dancing at a young age. In 1942 she joined the Ballet Russe de Monte Carlo. In 1946 she married Balanchine, the company's choreographer, or dance arranger. The couple soon moved to New York City. There Balanchine founded what later became the New York City Ballet. With that company Tallchief became known for her performances in *The Firebird* and *The Nutcracker*. For one season she was the prima ballerina, or lead dancer.

Tallchief retired as a dancer in 1965. She then taught ballet and directed the Lyric Opera Ballet in Chicago. In 1980

Maria Tallchief was a famous ballerina. She was known for her fine ballet technique.

Tallchief and her sister, who was also a dancer, founded the Chicago City Ballet. The company lasted until 1987.

Tallinn

Population
(2007 estimate)
396,850

Tallinn is the capital of Estonia, a country in northeastern Europe. Tallinn has a port on the Baltic Sea. It is Estonia's largest city.

Eastern Orthodox Christians worship at the Alexander Nevsky Cathedral in Tallinn, Estonia.

Tallinn's economy is based mainly on engineering, banking, trade, and other services. The shipment of goods through the port also brings money to the city. Factories in Tallinn make electronic equipment, machinery, cloth, and food products.

People settled in the Tallinn area in ancient times. The town was established by the 1100s. It suffered many invasions. It was ruled by Denmark, by German knights, and then by Sweden. Russia took control of all of Estonia in the early 1700s. In 1918 Estonia became an independent country with Tallinn as its capital.

In 1940 Estonia was forced to become part of the Soviet Union. For a time during World War II (1939–45), Germany controlled Tallinn.

Estonia became an independent country again in 1991. Tallinn remained its capital.

Talmud

The Talmud is a collection of ancient Jewish teachings. The written laws of Judaism are found in the Torah, the first five books of the Hebrew Bible. People in ancient Israel also followed many oral, or unwritten, teachings. Jewish leaders, called rabbis, eventually wrote down those oral laws and traditions. They also added their own comments. These included interpretations of the laws as

Young men study the Talmud at a special school called a yeshiva. The Talmud is a collection of ancient Jewish teachings.

well as stories that helped explain moral lessons. Together, these collections of laws, interpretations, and stories are known as the Talmud.

The Talmud was written by many rabbis over hundreds of years. The first part of the Talmud is the Mishna, which states the oral laws. Scholars think that a rabbi in Palestine (a region of the Middle East) finished the Mishna in the early 200s. It has six sections, for laws on daily prayer and farming, special rituals, marriage, criminal and civil law, rules of the temple, and cleanliness.

The second part of the Talmud is the Gemara, which contains comments on the ideas in the Mishna. Rabbis wrote the Gemara from the 200s through the 500s. There are two versions of the Gemara—one written in Palestine and

one written in Babylonia (a historic region of southwestern Asia). Modern scholars consider the Babylonian version to be more complete.

Tanganyika, Lake

Lake Tanganyika is the longest freshwater lake in the world and the second deepest. It is located in eastern Africa. The lake forms the border between Tanzania and the Democratic Republic of the Congo.

The lake is 410 miles (660 kilometers) long. It has a depth of 4,710 feet (1,436 meters). Many rivers flow into the lake. The largest are the Malagarasi, the Ruzizi, and the Kalambo. The lake's only outlet is the Lukuga River.

Rice and other crops are grown along the lake's shore. People also fish in its waters. Several important ports are found along the lake.

In 1858 Lake Tanganyika was first visited by Europeans. At that time British explorers were searching for the source of the Nile River.

Tanzania

Ngorongoro Crater is a popular tourist spot in Tanzania. Visitors to the area can see zebras and many other animals.

The country of Tanzania contains Africa's highest mountain and its largest lake. Dar es Salaam is the capital, but Tanzania's government has moved some of its offices to a new capital, Dodoma.

Geography

Tanzania has a coast on the Indian Ocean in the east. The country includes the mainland (called Tanganyika) and the islands of Zanzibar, Pemba, and Mafia. Tanzania shares borders with Kenya, Uganda, Rwanda, Burundi, the Democratic Republic of the Congo, Zambia, Malawi, and Mozambique.

Large plains, mountains, valleys, and lakes cover Tanzania's land. The great Serengeti Plain lies in the northeast. East of this plain is Mount Kilimanjaro, the highest point in Africa. Africa's huge Western Rift and Great Rift valleys run through the country. Along Tanzania's borders are three large lakes: Lake Nyasa,

Lake Tanganyika, and Lake Victoria. Lake Victoria is the world's second largest freshwater lake. (Lake Superior in North America is the largest.)

Most of Tanzania is hot and dry. The coast and the islands receive the most rain.

Plants and Animals

Forests grow in the rainy high areas. Grasslands and scattered trees cover much of the country. The large Serengeti National Park protects huge herds of wildebeests, gazelles, and zebras. The park also has many lions, leopards, hippopotamuses, giraffes, and baboons. Rhinoceroses and elephants survive in smaller numbers. Bands of chimpanzees live in the west.

People

Tanzania has more than 120 different ethnic groups. The Sukuma are the

The Masai people live in Tanzania and neighboring Kenya. They are nomads, meaning that they usually do not live in permanent settlements. They follow their herds of cattle and other animals throughout the year.

country's largest group. The Sukuma and other groups have their own languages. Most Tanzanians also speak Swahili, which different groups use to communicate with each other. Some Tanzanians also speak English. The country's main religions are Christianity and Islam. Many people follow traditional African beliefs. Most Tanzanians live in small villages or in the countryside.

Economy

Tanzania's economy depends on agriculture. The main food crops are cassava, corn, sorghum, bananas, rice, and sweet potatoes. Farmers also grow coffee, cotton, cashew nuts, tea, and tobacco. Cloves are grown on the islands of Zanzibar and Pemba.

Small industries in Tanzania make food products, cement, clothing, beer, and cigarettes. Mines provide gold, diamonds, and gems, including tanzanites.

History

Remains of some of the earliest known human ancestors have been found in Tanzania. Some are about 1.75 million years old. Groups of hunter-gatherers lived in the area as early as 5000 BC. Farmers and herders appeared around 1000 BC.

Arab and European Control

By AD 100 Arabs set up trading settlements on the East African coast. In the late 1400s the Portuguese arrived. About 200 years later the Arab rulers of Oman (a country on the Arabian Peninsula) gained control. More Europeans began arriving in the 1800s. Great Britain took over Zanzibar in 1890.

Germany took over the mainland in 1885. The land that is now Tanzania, Rwanda, Burundi, and part of Mozambique became known as German East Africa. In 1919, after World War I, Britain took control of the Tanzania portion. The British named the land Tanganyika.

Independence

Tanganyika gained independence in 1961, and Zanzibar became independent in 1963. The two joined to form the United Republic of Tanzania in 1964. Beginning in the 1990s hundreds of thousands of people poured into Tanzania to escape violence in neighboring countries.

Tapir

A tapir walks along a riverbank in Ecuador.

Tapirs are mammals that live in swamps and in forests near rivers. They are related to horses and rhinoceroses. Three kinds of tapir live in Central and South America. Another kind lives in South-east Asia.

A tapir has a heavy body with short legs. It has a soft, flexible snout like a short elephant trunk. Its feet have hooves, like those of a horse. Tapirs weigh 500 to 600 pounds (225 to 270 kilograms). They are 6 to 8 feet (1.8 to 2.4 meters) long, plus a short tail. They stand about 3 feet (1 meter) tall at the shoulder. The tapirs of the Americas have brown or gray hair. The tapir of Asia is black with some white parts.

Tapirs are shy animals that like the deep forest. They sleep most of the day. At night they come out to eat grass, leaves,

water plants, and fruit. A tapir uses its nose to move things aside and find food, like a horse does. Tapirs swim to escape their enemies, such as jaguars and tigers.

Tapirs are endangered, which means they are in danger of dying out. People hunt tapirs for food and sport. Plus, people have destroyed tapirs' homes by cutting down forests for wood.

Tarsier

Tarsiers are tiny animals with huge eyes. Their excellent senses of sight and hearing make them good nocturnal, or nighttime, hunters. Tarsiers belong to

A tarsier has pads on the tips of its long fingers and toes. The pads are like suction cups. They help the animal cling to a tree trunk.

the group of animals called primates. Other primates include lemurs, monkeys, and humans. There are at least three different species, or types, of tarsier.

Tarsiers live in the rain forests of Indonesia and the Philippines. They spend most of their time in trees and can leap between trunks 10 feet (3 meters) apart.

Tarsiers have brown, gray, or reddish fur. They are only about 6 inches (15 centimeters) long with a thin, 10-inch (25-centimeter) tail. Tarsiers have a round head with large eyes and ears. Like an owl, a tarsier can turn its head halfway around. Tarsiers' fingers and toes have pads like suction cups that help them to grip branches.

Tarsiers sleep in trees during the day and hunt on the ground at night. They jump on their prey and grab it with their hands. Tarsiers eat small animals such as insects, lizards, and snakes. They do not eat plants.

Some tarsiers live alone. Others live in male and female pairs. They can have babies at any time of the year. The female is pregnant for six months and then gives birth to one offspring. A baby tarsier can climb and jump after only a few days. Tarsiers can live for about 12 years.

Tashkent

Population
(2007 estimate)
1,959,190

Tashkent is the capital of the country of Uzbekistan. It is one of the largest cities in central Asia. It is also a major center of culture and industry.

Many cotton farms surround Tashkent. Factories in the city make cotton cloth and machines used to process the cotton. Other factories make airplanes, packaged foods, and chemicals. Many people in the city work in government or business offices.

A museum in Tashkent, Uzbekistan, has a domed roof. It is named after Timur, a Mongol leader who ruled what is now Uzbekistan in the 1300s.

Did You Know?

Tarsiers are the only primates that do not eat plants.

Tashkent dates back at least 2,000 years. In ancient times it was an important trading center. Many different groups, including the Turks, the Arabs, and the Mongols, ruled Tashkent over its long history.

In 1865 Tashkent became part of Russia. It soon became a regional capital. Along with Russia, the city became part of the Soviet Union in the early 1900s.

An earthquake destroyed much of Tashkent in 1966. The city was later rebuilt.

Uzbekistan became an independent country in 1991. Tashkent was made its capital.

Tasmania

Tasmania is the smallest state of Australia. Most of its land is a triangle-shaped island. The state also includes the nearby islands of Bruny, King, and Flinders as well as many smaller islands. Macquarie Island, about 900 miles

Tasmania, Australia, is home to small, fierce animals called Tasmanian devils. The island has many kinds of animals and plants that are found nowhere else on Earth.

(1,450 kilometers) to the southeast, is a part of Tasmania, too. Tasmania's capital is Hobart.

Geography

Tasmania lies about 150 miles (240 kilometers) south of Victoria, a state in southeastern Australia. The main island is 180 miles (290 kilometers) long. Its widest part is 175 miles (280 kilometers) wide. The state covers an area of 26,410 square miles (68,401 square kilometers).

A flat, raised area called a plateau covers much of the main island. Mountains rise in the west. Mount Ossa, at 5,305 feet (1,617 meters), is the highest point. The Derwent and the South Esk are the major rivers. The island also has more than 4,000 lakes. Most of these lakes are shallow. But Lake Saint Clair, with a depth of more than 700 feet (215 meters), is Australia's deepest lake. Tasmania's climate is mild and moist.

People

Tasmania is home to about 500,000 people. Most of them have British ancestors. Most of the people live in the southeast and the north. Hobart, in the southeast, is the largest city and main port. Launceston is the main city of northern Tasmania.

Economy

Many Tasmanians work in services—for example, communications, computer work, and tourism. Manufacturing is also important to the economy. Tasmania has many resources to use in manufacturing. Its forests provide wood for the lumber and paper industries. Mines provide iron, zinc, lead, copper, and tin, which are used to make metal products. In addition, Tasmania produces many foods and drinks. Tasmanian farmers grow potatoes, onions, peas, apples, grapes, and hops. They raise dairy cows, beef cattle, and sheep. The coastal waters provide fish.

History

Tasmanian Aborigines, or the first people in Tasmania, may have lived on the island as early as 40,000 years ago. The Dutch explorer Abel Tasman reached the island in 1642. He named it Van Diemen's Land after the governor-general of the Dutch East Indies (now Indonesia). At that time several thousand Tasmanian Aborigines lived on the island. The last full-blooded Tasmanian Aborigine died in 1876.

Tasmania became a part of the British colony of New South Wales (in

Port Arthur was a prison settlement in Tasmania, Australia, during the 1800s. Many convicts were taken there to work as punishment for their crimes. Today Port Arthur's buildings are in ruins. Many tourists visit them.

southeastern Australia) in 1803. In 1825 it became a separate colony. Many of the Europeans who lived there were prisoners sent to the island from Great Britain.

In 1856 the people of Van Diemen's Land elected their own government. They changed the island's name to Tasmania, after the explorer Tasman. In 1901 Tasmania became a state of Australia.

Tax

Governments can get money in various ways. For example, they can charge fees for such things as driver's licenses. But almost every government gets money simply by demanding a certain amount from its citizens. Money collected in this way is called a tax.

Did You Know?

Tasmania is home to a unique animal called the Tasmanian devil. It was named for its fierce growl and bad temper.

Purposes of Taxes

Governments collect taxes for several purposes. The most important purpose is to get money to pay for government services. These services include protection by an army or police, road building, and public education. Some governments use taxes to change people's behavior. For example, they may put high taxes on tobacco to get people to stop smoking. Finally, governments may raise or lower taxes to help their country's overall economy.

Types of Taxes

There are many different types of taxes. Among them are income taxes, property taxes, and sales taxes.

A tax on the money that people make is called a personal income tax. Companies in the United States withhold, or hold back, a part of almost every worker's pay. They send this money to the U.S. government. After the end of the year, people send in income tax returns, which are forms that tell the government how much money they made. Some people then have to pay still more money, while others get back some of their money in a refund. Sometimes governments make rich people pay higher taxes than poor people. Companies also pay taxes on the money they make. This tax is called corporate income tax.

Taxes on the value of land, buildings, and some large possessions (cars, for example) are called property taxes. In the United States, state and local governments collect property taxes.

Some taxes are used to build and to take care of such public areas as parks and roads.

When people buy goods and services, they often pay a sales tax on top of the price. Sales tax is usually a certain percentage of the selling price. In the United States, each state has its own sales taxes. However, many countries have national sales taxes. European countries use a form of sales tax called a value-added tax (VAT).

History

In ancient times, most people gave goods or services to a ruler instead of taxes. A farmer might give part of his crop. An ancient Egyptian might help to build a pyramid. However, the rulers of ancient Rome collected taxes in the form of money.

Taxes grew in importance over the years, although people were often unhappy when governments demanded them. The colonists who started the American Revolution in 1775 were angry because they had to pay taxes to Great Britain without having votes in Parliament (the British legislature). An unfair tax system was also one of the

In the Boston Tea Party of 1773, some American colonists destroyed tea to protest a British tax.

causes of the French Revolution, which began in 1789.

In the 1900s some state governments in the United States and governments of other countries looked for ways to collect money without raising taxes. Many began using lotteries (gambling games) to raise extra money.

Taylor, Zachary

A hero of the Mexican War, Zachary Taylor was elected the 12th president of the United States in 1848. He died after only 16 months in office.

Early Life

Zachary Taylor was born on November 24, 1784, in Montebello, Virginia. His parents, Richard Taylor and Mary Strother, came from important Virginia families. Zachary grew up on a plantation in what is now Kentucky. There

were no schools nearby, so he learned from a tutor.

In 1810 Taylor married Margaret Mackall Smith. They had six children.

Military Career

Taylor joined the Army in 1806. Over the next 40 years he became a respected military leader. His strength and courage earned him the nickname Old Rough and Ready. Taylor commanded troops in the War of 1812 and against Native Americans in various battles.

In 1846, just before the Mexican War, Taylor defended the border of Texas against Mexican troops. Taylor's troops defeated the Mexicans in two battles. After the United States declared war, Taylor crossed into Mexico and captured the city of Monterrey. In 1847 Taylor's forces defeated a larger Mexican army in

Zachary Taylor was the 12th president of the United States.

Taylor leads troops in the War of 1812.

1812

Taylor is elected president.

1848

Taylor dies in Washington, D.C.; Millard Fillmore becomes president.

July 9, 1850

Taylor joins the Army.

1806

Taylor defeats a Mexican army in the Mexican War.

1847

Taylor fights the spread of slavery.

1849

the battle of Buena Vista. That victory made Taylor a national hero.

Presidency

The Whig Party chose Taylor to run for president in 1848. He defeated the Democratic candidate, Lewis Cass, in the election. Taylor was the first man to become president without any experience in politics.

President Taylor had to deal with the difficult issue of slavery. Although he owned slaves, Taylor opposed the spread of slavery. In 1849 he recommended that California be admitted to the Union as a free state—one that would not allow slavery. Taylor's recommendation angered proslavery Southerners in Congress.

Taylor did not live to see the Compromise of 1850, which temporarily settled the slavery crisis. On July 4, 1850, he became ill with cholera. He died on

July 9 in Washington, D.C. Vice President Millard Fillmore became president.

Tbilisi

Population
(2006 estimate)
1,103,300

Tbilisi is the capital of Georgia, a small country in the Caucasus Mountains of Asia. The city lies on the Kura River. It is Georgia's largest city by far. It is also a major center of industry, culture, and research.

Shops in Tbilisi, Georgia, use both the Georgian alphabet and the Latin alphabet for their signs.

Factories in Tbilisi make machinery, clothing, processed foods, and drinks. Many people in the city work for the government or in tourism or other service industries. Tourists often visit Tbilisi to bathe in the natural hot springs, where hot mineral water spouts from the ground.

Tbilisi was founded in the 450s. The city lay along an important trade route between east and west. This made Tbilisi a valuable prize for many conquering groups. Over the centuries it was ruled by the Persians, Byzantines, Arabs, and Mongols.

In 1801 Russia captured Tbilisi. It became the capital of the Russian province of Georgia. The Soviet Union made Georgia one of its republics in 1921. In

1991 Georgia became an independent country with Tbilisi as its capital.

Georgia, Republic of

Tea

Tea is a strong and energizing drink. It is made by soaking the leaves of the tea plant in hot water. Tea is especially popular in Asia, the United Kingdom, many former British colonies, and the Middle East.

The most common types of tea are black and green, both of which are made from the same plant. The plant likely grew first in China. It now also grows in many other parts of Asia, especially India. Countries in eastern Europe, Africa, and South America also grow tea.

Some teas have added scents or flavors, such as jasmine or orange. Although

Workers pick tea leaves in Malaysia.

most people drink their tea hot, many people in the United States drink iced tea. Other hot drinks made with plant leaves, flowers, or roots may also be called tea. Examples include chamomile tea, South American maté, and South African *rooibos*, or red tea.

According to legend, people first drank tea in China in about 2700 BC. At first people used tea as medicine. In about the AD 200s it became a daily drink. The Dutch and the English brought tea from China to Europe in the 1600s. From there it spread to Europe's colonies.

Technology and Invention

Technology is the use of knowledge to invent new devices or tools. Throughout history, technology has made people's lives easier.

Ancient Technology

Early humans set themselves apart from other animals when they learned to control fire. About 2 million years ago, they also learned to use stones as weapons or tools. This began a period that is known as the Stone Age. Stone Age people also learned to make pottery from clay.

Later on, people learned to work with metal. The people of Anatolia (now in Turkey) made copper tools and weapons as early as 6500 BC. In about 3000 BC people discovered that mixing copper with tin formed a stronger

Thousands of years ago Stone Age people learned to create tools and weapons by chipping away at pieces of stone.

metal—bronze. This discovery began the Bronze Age.

Two important developments took place in the Middle East at the beginning of the Bronze Age. One was the invention of the ox-drawn plow. The other was the invention of the wheel and axle. Many scientists date the beginning of civilization, or advanced culture, to this time.

In the 1000s BC the Hittite people of Anatolia learned to work with iron, which is stronger than bronze. This began the Iron Age. Eventually, people throughout Europe, Asia, and northern Africa made strong iron tools and weapons.

Technology in the Middle Ages

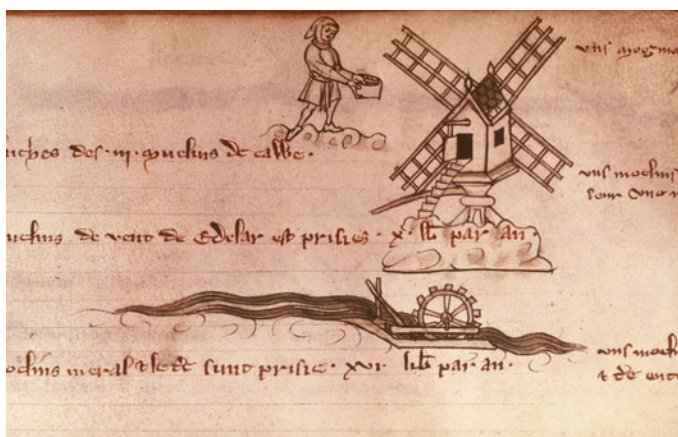

A period called the Middle Ages began in Europe in about AD 500 and lasted until about 1500. Many advances during this time came from other places—

for example, China, the Byzantine Empire, Persia, India, and the Islamic world.

By about the 1400s, Europeans learned the Chinese technique of casting iron. This involved heating iron in a special furnace and then pouring it into a mold to harden. Chinese inventors also developed black powder, the original form of gunpowder.

New sources of power were developed during this time. The horse became a major energy source with the invention of the padded horse collar. The collar meant that the horse could be used to pull plows and other objects. People also harnessed water and wind power to run new types of water mills and windmills.

Two kinds of technology helped to end the Middle Ages and to begin modern times. The rudder (a part for steering a ship), the triangular sail, and the com-

A French book from the late 1200s shows two important inventions: the windmill and the waterwheel. These devices use the power of the wind or the water to run machines, often to grind grain. Before they were invented, the labor of people or animals powered the machines.

pass made possible the sea voyages of European explorers. In about 1450 Johannes Gutenberg invented the printing press. As a result books could be produced in great numbers. Many people learned to read, and learning became widespread.

Industrial Revolution

Iron, Coal, and Steam

Early in the 1700s two English inventors set the stage for the Industrial Revolution. This was a period of great growth of industry. Abraham Darby discovered that a coke-burning furnace produced good iron. Coke is a form of coal. Thomas Newcomen invented a pump that kept coal mines from filling with water. A steam engine powered the pump.

With these developments, coal and iron production expanded rapidly. Iron remained the main metal for building and toolmaking until the late 1800s. At that time steel (a mixture of iron and carbon) began to replace regular iron.

Meanwhile, in the late 1700s steam began to replace wind and water as the major source of power. In a steam engine, burning coal heated water. The boiling water produced the steam that ran the engine.

Machines and Factories

Other inventions also sped up the production of goods—especially textiles, or cloth. By the early 1800s such machines as the power loom made cloth faster and easier to weave. Cloth making moved from homes and workshops into large

mills and factories. The factories used steam engines to run many of their machines. Other industries followed this model.

Transportation

Between 1765 and 1782 James Watt of Scotland greatly improved the steam engine. John Fitch of the United States ran a steamboat as early as 1787. In 1803 Richard Trevithick created the steam locomotive.

In 1856 Henry Bessemer of England invented an improved way of making steel. People began using steel to build railroads, ships, and bridges. (People also used steel to build the first skyscrapers.)

In 1876 the German engineer Nikolaus August Otto built a gasoline-powered engine. By 1885 two Germans named Gottlieb Daimler and Karl Benz had used gasoline engines in the first successful automobiles.

Electricity

In the first half of the 1800s scientists learned to generate, or produce, electricity. In 1835 Samuel F.B. Morse of the United States used electricity in his telegraph. This invention allowed people to communicate across long distances. In 1876 the U.S. inventor Alexander Graham Bell invented the telephone, which also used electricity. Thomas Edison demonstrated the electric lightbulb in 1879. Electric power also came to be used for electric railways in cities.

A steam locomotive called the Dewitt Clinton hauled carriages on railroad tracks in the early 1830s.

Petroleum and Chemicals

In the second half of the 1800s petroleum, or oil, became a major power source. Edwin Laurentine Drake drilled the first successful oil well in the United States in 1859. Petroleum can be made into gasoline, fuel oil, and many other products.

In 1856 William Henry Perkin of England made a breakthrough in the

Thomas Alva Edison holds up an early version of the electric lightbulb, which he developed in the late 1800s.

field of chemistry. Starting with coal tar, which is made from coal, he invented the first synthetic, or artificial, dye. Coal tar and petroleum proved to be useful in the making of drugs and plastics as well.

Modern Technology

Mass Production

Modern manufacturing methods can produce goods in large numbers. This is called mass production. An important technique of mass production is the assembly line. An assembly line product is put together one piece at a time as it moves past workers on a conveyor. Each worker does just one task. In the early 1900s Henry Ford perfected the assembly line to make automobiles in the United States.

Later in the 1900s robots began to replace assembly-line workers. A robot is a machine that operates on its own.

A machine in a factory produces polyester cloth. Polyester is an artificial fiber made from coal and petroleum (oil) products.

Air and Space

In 1903 the Wright brothers of Ohio produced the first successful airplane. The Russian-born inventor Igor Sikorsky developed the helicopter in the United States in the 1930s. At about the same time Frank Whittle of England developed a jet engine for airplanes.

German scientists used rockets in World War II (1939–45). Rocket engines carry oxygen as well as fuel. This allows them to work in outer space, where there is no oxygen. After the war the Soviet Union and the United States developed programs to send people into outer space in space ships. In 1957 the Soviets put the first artificial satellite into orbit around Earth. The Americans landed the first human on the Moon in 1969.

Energy

Beginning in the 1900s scientists found ways to harness the energy of sunlight. Solar furnaces use mirrors to focus solar heat. Solar cells make electricity from sunlight.

Scientists also found ways to use the energy that holds atoms together. Atoms are the tiny units that make up everything. This energy is called nuclear energy. It found its first use in very powerful bombs called atom bombs that the United States used in World War II. Scientists soon learned to use nuclear energy to make electric power.

Electronics and Computers

Electronic products changed people's lives greatly during the 1900s. Electronic

products rely on electricity to carry or process information. Radios were some of the first electronic products. By the 1920s radio programs were being broadcast into people's homes. Television, a later electronic product, came into use during the 1930s and 1940s. The first electronic computers were invented in the 1940s as well.

Later in the 1900s electronic products became smaller. People discovered how to fit the parts that make electronic products work onto tiny chips called integrated circuits. These chips made personal computers possible. Other inventions of the late 1900s also used integrated circuits. They included compact disc players, cellular telephones, digital cameras, and many other electronic products.

Technology and Medicine

In the 1900s scientists began applying technology directly to living things. Scientists developed electrical devices to help people with disabilities. Some devices, such as hearing aids and kidney dialysis machines, operate from outside the body. Doctors place other electrical devices inside the body. For example, pacemakers help keep hearts beating steadily.

In addition, scientists learned how to cut and rejoin genes. (Genes are tiny units within cells that carry information about a living thing.) This is called genetic engineering. Genetic engineering may help to cure human diseases. It also

A dialysis machine helps a patient whose kidneys are not working properly. The machine does the work that the kidneys would do. Blood from the patient flows through the machine, where it is cleaned. The blood then returns to the patient's bloodstream.

helps to produce food plants that resist diseases.

Tecumseh

Tecumseh was a leader of the Shawnee Indians. He fought to keep American settlers out of the Ohio River valley.

Tecumseh was born in 1768 in what is now Ohio. His father was a Shawnee chief. His mother belonged to the Creek tribe. When Tecumseh was about

Tecumseh led American Indians in a losing struggle to keep their land.

6 years old, his father was killed in a battle with white settlers. Then Tecumseh's mother returned to her people. An older sister and brother raised Tecumseh. A Shawnee chief later adopted him.

Tecumseh spent his life fighting American settlers who were taking land from Indians. As a boy during the American Revolution, he helped the British attack American colonists. Later he united Indian tribes to fight Americans. He worked with his brother Tenskwatawa, a religious leader.

Tecumseh saw the War of 1812 as a chance for his people to recover the land they had lost. The war was between Great Britain and the United States. Tecumseh and his warriors helped the British. They hoped a British victory

would allow the Indians to take back their land.

British and Indian forces captured Detroit, Michigan. Later Tecumseh's army invaded Ohio with the British. After failing to capture a fort near Toledo, they crossed into Canada. The British and the Indians were defeated near the Thames River in Ontario on October 5, 1813. Tecumseh was killed in the battle.

Teeth

Many vertebrates, or animals with backbones, have teeth inside their mouths. Teeth are hard, bony structures that grow from the jawbone. Humans and other animals use their teeth to bite and to chew food.

Types of Teeth

Teeth of different shapes do different jobs. Front teeth, called incisors, bite and cut. Pointed teeth, called cuspids or canines, tear and shred. Teeth with two points, called bicuspid, tear and grind. Back teeth, called molars, crush and grind.

Humans have two sets of teeth during their lives. The first set consists of 20 teeth. These are called primary, or baby, teeth. When a child is about 6 years old, these teeth begin to loosen and fall out. Over the next eight years 28 permanent teeth replace all the baby teeth. When a person is around age 20, four more

A diagram shows the teeth of people at two different ages. Humans have two sets of teeth during their lives. The first set is called the primary teeth. At about age 6, one's primary teeth begin to fall out. The second set, called the permanent teeth, replaces them.

molars, called wisdom teeth, grow in. Many people have their wisdom teeth removed to keep their other teeth straight.

Tooth Structure

The visible part of a tooth is called the crown. Several layers make up the

crown. The outer layer is a hard white covering called enamel. Enamel protects the tooth from wear and tear. Below the enamel is dentin. This yellow, bonelike material is softer than enamel. Dentin makes up the largest part of the tooth.

The center of a tooth is called the pulp. The pulp is soft tissue that contains blood and nerves. Nerves in the teeth send signals to the brain about heat, cold, or pain.

The soft tissue around the base of each tooth is called the gum. The roots of the teeth lie below the gums. A tooth has between one and three roots. A glue-like substance called cementum coats the roots. Cementum keeps the teeth stuck in the jawbone.

Problems with Teeth

A common problem with teeth is tooth decay, or cavities. Cavities can form if a sticky film called plaque is allowed to build up on the teeth. Germs in plaque eat away the tooth and cause pain and infection. Dentists fill cavities to prevent further damage. Plaque can also make gums red, sore, and weak. Over time, weakened gums can wear down so far that the teeth fall out. People can keep teeth healthy by brushing and flossing teeth and visiting the dentist.

Sometimes the teeth do not bite together properly. Dentists called orthodontists can straighten teeth.

Tel Aviv–Yafo is a large city in Israel, a country in the Middle East. It is Israel's main center of business and culture. The city lies on the Mediterranean Sea. As its name suggests, it was created by combining two towns: Tel Aviv and Yafo. Yafo is the Hebrew name for the ancient port city of Jaffa.

Most of Israel's banks and insurance companies have headquarters in Tel Aviv–Yafo. Many people in the city work in business services, tourism, and trade. Factories in Tel Aviv–Yafo process diamonds and foods and make clothing, medicines, and high-technology products.

Tel Aviv–Yafo is a modern city on the shore of the Mediterranean Sea.

Did You Know?

The historic section of Tel Aviv–Yafo is called Old Jaffa. It is known for its gardens, narrow alleys, and art studios.

Many thousands of years ago Jaffa was a city of the Canaanite people. It was later ruled by the Egyptians, Israelites, Persians, and others. Muslim Arabs ruled Jaffa from about the 1200s to the middle of the 1900s.

Jewish settlers founded Tel Aviv in 1906. At first it was a suburb of Jaffa. At the time both cities were part of the land called Palestine. In 1948 part of Palestine, including Tel Aviv and Jaffa, became the country of Israel. Israel soon combined Tel Aviv and Jaffa to create the city of Tel Aviv–Yafo.

Telecommunication

Telecommunication is any kind of human communication that takes place across a distance. Several inventions have helped people to communicate quickly over great distances.

The first important step in telecommunication was the telegraph. It was invented in the 1830s by Samuel F.B. Morse. His invention could send coded messages instantly over a wire. Long and short electrical signals, called Morse Code, stood for letters of the alphabet. By 1866 telegraph cables under the Atlantic Ocean linked North America and Europe.

The telephone made it possible to send the sound of the human voice over a wire. Alexander Graham Bell invented the telephone in 1876. Today telephone

signals may travel through wires, through fiber-optic cables, or even as radio waves.

In the 1890s Guglielmo Marconi invented the wireless telegraph, or radio. Like the telegraph, his invention sent messages in code, but the messages traveled through the air as radio waves. Spoken messages were first sent by radio in 1907. The first network of radio stations in the United States was the National Broadcasting Company (NBC). It broadcast its first radio programs in 1926.

By the 1930s it was possible to send a picture as well as a sound signal over radio waves. This was the beginning of television (TV). In 1936 the British Broadcasting Corporation (BBC) started the world's first TV programming. Now television signals may travel as radio waves or through cables.

Today the Internet makes it possible for people around the world to communi-

Short-wave, microwave, cellular telephone, and other types of telecommunication antennas receive and send messages from high ground near Phoenix, Arizona.

cate through computers. The U.S. government developed an early form of the Internet in the 1960s and 1970s. Telephone wires, television cables, fiber-optic cables, and satellites connect computers around the world to the Internet.

Telegraph

The telegraph is a device for communicating over a distance. It uses electricity to send coded messages through wires. In the middle of the 1800s the telegraph was the fastest way to communicate over long distances.

Invention of the Telegraph

The first two working telegraphs were invented at about the same time in the 1830s. In Great Britain two inventors built a telegraph that used six wires and five needles. A part called the transmitter sent electric currents through the wires. At the other end, the currents moved needles on a part called the receiver. The receiver had a special plate with letters and numbers on it. The needles pointed to the letters and numbers to spell out messages.

Meanwhile, in the United States, Samuel F.B. Morse worked on a telegraph of his own. Morse developed a new system for sending telegraph messages. It used dots, dashes, and spaces to stand for letters and numbers. This system is called Morse Code. Morse and his part-

The telegraph invented by Samuel F.B. Morse had a key for tapping out messages.

ner, Alfred Vail, built a telegraph with just one wire. The transmitter had an arm called a key. The person sending the message pressed the key to tap out messages in Morse Code.

In 1843 the U.S. government paid Morse to build the first long-distance telegraph line. It ran 35 miles (60 kilometers) from Washington, D.C., to Baltimore, Maryland. The next year Morse sent the first message through the system. The message was “What hath God wrought!”

The Telegraph Industry

Morse’s telegraph started an entire industry. By the end of 1861 a telegraph line ran all the way across the United States. By the end of the 1800s telegraph lines crisscrossed the world. In the early 1900s a new kind of telegraph could print out messages. Later telegraphs could send messages through the air instead of through wires. The wireless telegraph was an early form of radio. By the end of the 20th century the tele-

graph had been mostly replaced by faster communications that used computers.

Telephone

The telephone is a very common device for communicating over a distance. With a telephone, a person can talk almost instantly with someone on the other side of the world. Most telephones are linked to each other by wires. Others, such as cell phones, are connected by invisible radio waves that travel through the air.

How a Traditional Telephone Works

A traditional telephone depends on wires to send sound. It has a handset and a base that are connected by a cord. The handset is the part that a person holds to make or answer a call. One end of the handset has a microphone for talking. The other end has a small loudspeaker for listening. The base connects the telephone to an electric current through a wire.

When the caller speaks into a telephone, the microphone changes the sound of the person's voice into an electric signal. The base sends out the signal through its wire. How the signal travels from there depends on where the call is going. It can remain an electric current, passing through wires and cables. It can travel through thin glass fibers in the form of

light. This way of sending information is called fiber optics. Or the signal can be changed into radio waves and sent through the air by antennas and satellites. When the signal reaches the telephone at the other end, its loudspeaker changes it back into the sound of the caller's voice.

Cordless Telephones

A cordless telephone is more convenient than a traditional telephone. It does not have a cord connecting the handset and the base. It allows a person to walk around the house while talking.

A cordless telephone uses both electric signals and radio waves. The base receives the call as an electric signal, like a corded phone does. Then the base turns the electric signal into radio waves. Using an antenna, the base sends the waves through the air to the handset. The handset's antenna picks up the waves. Then the handset turns the waves back into sound.

Cell Phones

Cellular telephones, or cell phones, are even more convenient than cordless phones because they work over a much wider area. Because of this, in some places they are called mobile phones. They send and receive calls using radio waves.

Cell-phone companies divide up an area, such as a city, into sections called cells. Each cell has a tower for receiving and sending out radio waves. If a caller travels from one cell into another, the call switches from tower to tower. This means that a cell phone can work any-

Did You Know?

The word telephone comes from the Greek words *tele*, meaning "far" and *phone*, meaning "sound."

How a Phone Sends and Receives Sound

place that the cell-phone company's network reaches. Cell-phone networks can stretch across an entire country.

A cell phone sends out a special signal whenever it is turned on. The signal lets the network know where to send the calls that come to that phone.

Many cell phones can do things other than make calls. Certain kinds can get information from the Internet or send and receive e-mail. Some cell phones can take photographs.

History

Not everyone agrees who invented the telephone. However, Alexander Graham Bell usually gets the credit. In 1876 he sent the first words by telephone. Later that year Bell made the first long-distance call. He talked with his assistant, who was 2 miles (3.2 kilometers)

away. By 1915 people could place telephone calls across the United States. Telephone service across the Atlantic Ocean began in 1927. The first cell phones appeared in the late 1970s.

Telephones had no dials in the first part of the 1900s. Instead of dialing, callers told a telephone operator the number they wanted to call.

At about the same time advances in electronics made telephones useful for more than just talking. Fax machines became common in the 1970s. They use telephone wires to send words and pictures. Today many computers connect to the Internet through telephone lines.

Telescope

A telescope is an instrument that allows people to see distant objects. Telescopes are important tools in astronomy, or the study of planets, stars, and other objects in outer space. There are several different types of telescopes. Some, called light telescopes, gather light from objects. Other telescopes gather different kinds of information about the object being viewed.

Did You Know?

The telescope forever changed people's understanding of the universe. It allowed people to see things that they could only guess about before.

Light Telescopes

There are two basic types of light telescopes: refracting telescopes and reflecting telescopes. A refracting telescope uses lenses. A lens is a curved piece of glass that refracts, or bends, light. A reflecting telescope uses mirrors. Some telescopes use both lenses and mirrors.

A refracting telescope is a tube with one or more lenses at each end. Light from a far-off object enters the far end of the tube. The lens or lenses at that end, called objective lenses, bend the light. They focus it at a point near the other

A refracting telescope uses lenses to enlarge an image. A reflecting telescope uses curved mirrors and sometimes lenses as well.

end of the tube. The light forms an image, or picture of the object, at this point. The lens or lenses at this end, called the eyepiece, magnify the image.

Reflecting telescopes are much more powerful than refracting telescopes. A reflecting telescope has a curved mirror at the bottom of the tube. Light from an object reflects, or bounces, off the mirror. The mirror focuses the light at a point in the tube. A second mirror sits in the way of this focused light. It sends the light out the side of the tube, through an eyepiece. A lens in the eyepiece magnifies the image formed by the light.

In some reflecting telescopes light passes through a lens before hitting the curved mirror. The lens helps to make the image sharper.

Some light telescopes are fairly small tubes that sit on a stand and can be carried around easily. Buildings called observatories house much larger, more powerful light telescopes. Spacecraft may also carry light telescopes. The Hubble Space Telescope, which orbits Earth on a spacecraft, is a type of reflecting telescope.

Other Telescopes

Some types of telescopes do not collect light. These telescopes collect other forms of energy from space—for example, radio waves, infrared radiation (a type of heat), and X-rays. Planets, stars, gas, and other things in space give off these types of energy.

Radio telescopes look like huge bowls. They collect radio waves that travel to Earth's surface. Infrared, X-ray, and other similar telescopes are mounted on spacecraft.

All these telescopes allow scientists to gather information about things in space that cannot necessarily be seen. For example, they have shown that there is water vapor in other parts of the Milky Way galaxy. They have also helped scientists understand how stars and planets form and how stars die.

History

By the early 1600s several people had made simple refracting telescopes. In

The Very Large Array is a group of 27 bowl-shaped radio antennas in the state of New Mexico. Each antenna is 82 feet (25 meters) across. When used together they make one very powerful radio telescope.

1609 the Italian scientist Galileo improved the design of a telescope made by a Dutch inventor. Later in the 1600s several inventors, including the English scientist Isaac Newton, built reflecting telescopes.

A U.S. astronomer built the first radio telescope in 1937. Other scientific telescopes developed along with spacecraft, which scientists began launching in the 1950s.

Television

Television, or TV, is a system for sending moving pictures and sound from one place to another. It is one of the most important and popular forms of communication. TV programs provide news, information, and entertainment to people all over the world.

People who own plasma TVs often hang them on a wall. Plasma TVs are thinner and lighter than standard TVs.

How TV Works

TV begins with a television camera, or video camera. The camera records the pictures and sound of a TV program. It changes the pictures and sound into electric signals. A TV set receives the

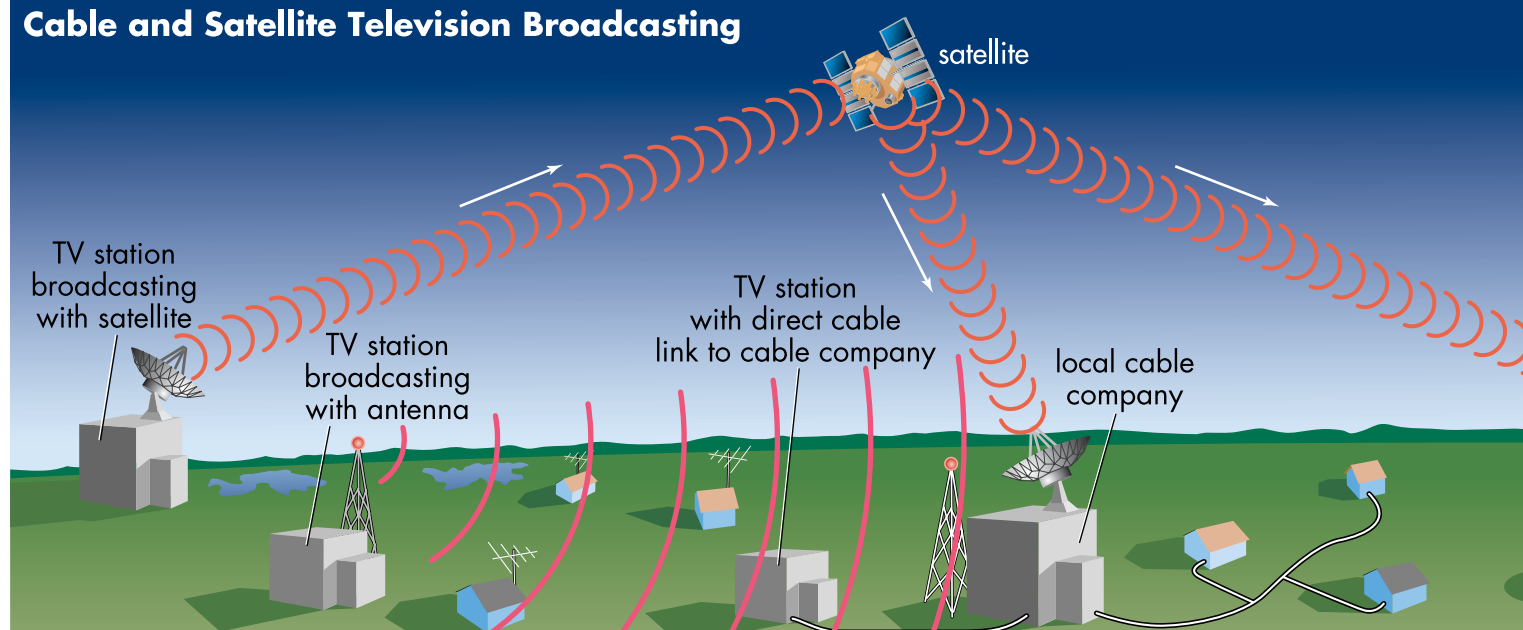

signals and turns them back into pictures and sound.

The TV Signal

A standard TV camera changes the pictures into an electric signal called the video signal. The video signal carries the pictures in the form of tiny dots called pixels. The camera's microphone changes the sound into another electric signal, called the audio signal. The video and audio signals together form the TV signal.

Digital TV, or DTV, is a newer way of handling TV signals. A digital TV signal carries pictures and sound as a number code, like a computer does. A digital signal can carry more information than a standard signal can, which creates better pictures and sound. High definition TV, or HDTV, is a high-quality form of digital TV.

Cable and Satellite Television Broadcasting

Television stations may broadcast, or send, TV signals with antennas, satellites, or cables. The signals sent with antennas may reach houses directly.

A TV signal can reach a TV set in several ways. Local TV stations use antennas to send, or broadcast, signals through the air as radio waves. Cable TV stations send signals through underground cables. Satellites, or spacecraft, traveling high above Earth can send signals to special antennas called satellite dishes. A signal can also come from a VCR, DVD player, or DVR (digital video recorder) connected to the TV set. VCRs, DVRs, and some DVD players can record a TV signal coming into the TV and then play it back later.

Display

A standard TV set turns the video signal into beams of tiny particles called electrons. It shoots these beams at the back of the screen through a picture tube. The beams “paint” the pixels on the screen in a series of rows to form the picture. The TV set sends the audio signal to loudspeakers.

LCD and plasma TVs form the picture differently. They do not use a picture tube and electron beams. Because they do not hold a picture tube, LCD and plasma TVs are much thinner and lighter than standard TVs. They can even hang on a wall.

LCD stands for liquid crystal display. Liquid crystal is a substance that flows like a liquid but has some tiny solid parts, too. The display sends light and electric current through the liquid crystal. The electric current causes the solid parts to move around. They block or let light through in a certain way to make the picture on the screen.

A plasma display has many tiny cells, or units, containing gas. Electricity sent through the gas forms a plasma. A plasma is a bunch of particles that have an electric charge. The plasma gives off light, which makes the picture.

Signals sent through satellite or cables go first to a cable or satellite TV company. Those companies then send the signals to homes through other cables or satellites.

History

Inventors in Great Britain and the United States made the first demonstrations of TV in the 1920s. The first working TV sets appeared in the 1930s. In 1936 the British Broadcasting Corporation (BBC) started the world's first TV programming. The first commercial television stations in the United States started broadcasting in 1941.

Many families bought their first TV set after World War II, in the late 1940s and the 1950s. The first sets could show only black-and-white pictures. Color TV and cable TV started in the 1950s. Digital TV arrived in the 1990s.

Temple

A temple is a building that people use for worshipping gods or for other religious purposes. The houses of worship in many ancient religions were called temples. Hinduism, Buddhism, and

several other religions today also have temples. The architecture of temples varies from place to place.

The temples of ancient Mesopotamia (in what is now Iraq) were highly decorated towers called ziggurats. They were shaped like pyramids with large steps. In ancient Egypt temples often had large, decorated columns. In the Americas the Inca and the Maya built pyramid-shaped temples.

The ancient Greeks and Romans built temples that have influenced architecture until the present day. A Greek temple was made of marble or stone. It had columns that enclosed a space holding an image of a god. An altar to that god stood outside the temple. Roman temples were similar, but the altar was inside the temple.

Hinduism and Buddhism began in ancient India. People there carved temples out of cliffs. Later Indian temples were freestanding. They often included tall, elaborately carved towers. Today Hindu and Buddhist temples throughout eastern Asia range from small and simple to huge and complex.

Other religions that have temples include Shinto and Jainism. Jewish synagogues are often called temples, too. Islamic temples are called mosques. Christian houses of worship generally are known as churches. However, Mormons (followers of the Church of Jesus Christ of Latter-day Saints) have temples for special religious ceremonies.

Tennessee

The Great Smoky Mountains lie in the eastern part of Tennessee.

The name Tennessee comes from a Cherokee Indian word, Tanasi. Tanasi was the name of a major Cherokee village in the area. Tennessee is known as the Volunteer State. The nickname came from the large number of men who volunteered for military service in the War of 1812. The capital is Nashville.

Geography

Tennessee is located in the south-central part of the United States. It borders eight states. In the west the Mississippi River separates Tennessee from Missouri and Arkansas. Virginia and Kentucky lie to the north of Tennessee. Mississippi, Alabama, and Georgia are to the south. In the east Tennessee shares a border with North Carolina.

Eastern Tennessee lies within the Appalachian Mountain chain. The Blue

Ridge Mountains along the Tennessee–North Carolina border include the range known as the Great Smoky Mountains. West of the mountains is an area of low ridges. The central part of the state is a region with generally flat but sometimes rolling land. Western Tennessee consists of plains, including a narrow strip of swamp and floodplain along the Mississippi River.

Tennessee has a moderate climate. Winters are cool and summers are warm.

People

Most of Tennessee's early white settlers came from the Eastern states. These people were mainly English, Scots-Irish, and German. Today about four fifths of the Tennessee population is white and of European heritage. African Americans are by far the largest minority group; they represent 16 percent of the state's population.

Economy

Manufacturing and service industries dominate Tennessee's economy. The state's factories produce motor vehicles

and parts, processed foods, chemicals, and many other products.

Leading service industries include health care, real estate, and tourism. Tourists visit Tennessee's natural wonders, such as the Great Smoky Mountains. Civil war battlefields and the musical attractions located in Memphis and Nashville are also popular. Tennessee's major agricultural products include cattle, chickens, greenhouse plants and produce, and dairy goods.

History

Native Americans including the Cherokee and the Chickasaw lived in the area that is now Tennessee before European settlers arrived. In the second half of the 1600s both the French and the English claimed the area. Settlers from both countries built forts and trading posts. In 1763 Britain took control of the whole area.

The first permanent white settlement in the region was started in 1769. Many other people from the American colonies followed. In 1796 Tennessee became the nation's 16th state.

The American Civil War (1861–65) divided Tennessee. The eastern part of the state sided with the North, but the western planters and slave owners supported the South. Tennessee battlefields at Shiloh and other places were sites of intense fighting during the war.

In 1933 the United States government created an agency called the Tennessee Valley Authority (TVA). Under the

TVA, new dams and hydroelectric power plants were built on Tennessee rivers. The dams and power plants helped control floods and generated electricity for the region.

Tennessee was a center of the civil rights movement in the 1950s and 1960s. Tragically, Memphis was the scene of the 1968 killing of civil rights leader Martin Luther King, Jr. In the 1990s the population of Tennessee increased faster than that of the United States as a whole. Tennessee's economy also grew during this period. The state supported this growth by encouraging the development of many different types of industry.

Tennis

Tennis is a fast-paced sport for two or four players. It can be played either outdoors or indoors. Tennis players use a stringed racket to hit a ball over a net. They score points by hitting the ball out of the opponent's reach.

Court and Equipment

Tennis is played on a rectangular court. The court is 78 feet (23.8 meters) long. The width depends on whether there are two or four players. For a singles match (two players), the court is 27 feet (8.2 meters) wide. For a doubles match (four players), the court is 36 feet (11 meters) wide. The surface of the court may be grass, clay, or a hard material such as concrete. The court is divided in half by a net that is 3 feet (0.9 meter) high.

The only equipment needed for tennis is a racket and a ball. A tennis racket has a

frame with crossed strings attached to it. Most racket frames are made of a lightweight material such as graphite. Tennis balls are small, light, and bouncy. They are usually yellow or white.

Playing the Game

A tennis game begins with a serve. One of the players, called the server, stands at one end of the court. The server throws the ball into the air and tries to hit it over the net. The opponent tries to return the serve—hit the ball back over the net. The players hit the ball back and forth until one of them fails to make a good return. Then the other player scores a point. The players try to hit the ball to a part of the court where the opponent will have a hard time returning it.

The serve is the most important stroke in tennis. The served ball must land in a boxed area on the opponent's side of the

A tennis court is 78 feet long. Its width depends on how many people are playing. In a singles match, or a match for two players, the court does not include the alleys. The alleys are used only for doubles matches, in which four people play. The alleys make the court wider.

Doubles tennis is played with two players on a side. A doubles court is slightly wider than a singles court.

court. If the ball misses that box, it is called a fault. The server then gets another chance to serve. If the server makes another fault, the opponent gets a point. On the other hand, the server earns a point by serving the ball so well that the opponent cannot hit it. This is called an ace.

A player needs four points to win a game. Points are counted in four stages: 15 for the first point, 30 for the second, 40 for the third, and game. A score of zero is called love. The server's score is given first. For example, if the score is 30–love, the server has two points and the opponent none. If both players reach 40, the score is called deuce. The player who scores the first point after deuce must also get the next point to win the game. In other words, a player must win by two points.

A series of games makes up a set, and a series of sets makes up a match. The first player to win six games traditionally wins a set. But again, a player must win by two. This means that a player cannot win a set by a score of 6–5. The set con-

tinues until one player wins by two games—for example, 7–5 or 8–6. To win a match, a player usually has to win either two out of three or three out of five sets.

History

Major Walter Clopton Wingfield of Great Britain published the first book of tennis rules in 1873. The first tennis championship took place four years later. It was held in a part of London, England, called Wimbledon. Tennis reached the United States in the 1870s.

Four major international tennis tournaments take place each year—one in Australia, one in France, one in the United Kingdom, and one in the United States. A player who wins all four is said to have won the Grand Slam.

Tenzing Norgay

Tenzing Norgay was an expert mountain climber. In 1953 he and Edmund Hillary of New Zealand became the first people to set foot on top of Mount Everest, the world's tallest peak.

Tenzing Norgay was born on May 15, 1914, in Tshechu, Tibet. He was a Sherpa. Sherpas are people known for their strength and endurance at high altitudes. Tenzing worked on many Everest expeditions. On March 10, 1953, he began climbing with a group that included Hillary. The two men reached the top on May 29. Tenzing left a food offering, a common practice in

his Buddhist religion. He died on May 9, 1986, in Darjeeling, India.

Teresa, Mother

The Roman Catholic nun called Mother Teresa received the Nobel peace prize in 1979 for helping to relieve the sufferings of the poor. She was especially active in the slums of Calcutta (now Kolkata), India.

She was born on August 27, 1910, in Skopje, Macedonia. Her birth name was Agnes Gonxha Bojaxhiu. In 1928 she joined a community of nuns in Ireland called the Sisters of Loretto. Weeks later she sailed to India. For the next 17 years she taught at a school in Calcutta run by the Sisters of Loretto.

Mother Teresa

In 1946 Mother Teresa decided to spend her life helping the sick and the poor. She studied nursing and started working in the slums. In 1948 she founded the Missionaries of Charity, a religious order of women dedicated to serving the poor. Mother Teresa led the order for nearly 50 years. It opened schools for children and centers to treat the blind, the disabled, the old, and the dying. She received many awards for her work.

In 1989 Mother Teresa suffered a heart attack. Despite her poor health, she continued to work in Calcutta most of the time until she retired in March 1997. She died there on September 5, 1997. After her death, the Missionaries of Charity carried on her work in more than 90 countries.

Termite

Termites are insects that eat wood. They can damage buildings, furniture, and other wooden items. There are more than 1,500 species, or kinds, of termite. They are most common in tropical rain forests.

Termites build damp nests in wood or underground. Some underground nests rise partly above the ground as mounds or towers. The nests are made of dirt, clay, and chewed wood.

Termites live in organized groups called colonies. Each colony has three kinds of

Did You Know?

In 1963 the Indian government awarded Mother Teresa the title Padmashri ("Lord of the Lotus") for her services to the people of India.

Termites eat their way through a piece of wood.

termite: royalty, soldiers, and workers. Each kind of termite has a certain job within the colony.

The royalty is made up of a king and queen. They are responsible for reproduction. These termites have wings and eyes. A queen can grow to more than 4 inches (10 centimeters). Kings are smaller.

Once a year pairs of young kings and queens leave the nest. Each pair starts a new colony. Soon the young queens begin laying 3,000 to 5,000 eggs a day.

The soldiers and the workers are grayish white, blind, and wingless. They are usually less than 0.25 inch (1 centimeter) long. Soldiers guard the nest against enemies, mainly ants. Workers provide the colony with food.

Termites eat mostly wood. They attack and often destroy trees, fence posts, houses, and furniture. But termites also help nature by breaking down dead wood into nutrients. The nutrients can

then be recycled and used by bacteria and plants.

Insect • Nest

Terrorism

Terrorists are people who use fear to try to change society. They create fear by committing violent crimes. In the 21st century many countries consider terrorists to be more dangerous than enemy armies.

Goals

Not all terrorists want the same thing. Some want to overthrow a government. They are called revolutionary terrorists. Examples include the Red Brigades in Italy in the 1970s and the Shining Path in Peru in the 1980s and 1990s. Both groups wanted to establish Communist governments.

Other terrorists want independence for a particular group. In Sri Lanka a group called the Liberation Tigers seeks a homeland for the Tamil people. Several Palestinian groups want to start a Palestinian state in the Middle East and to weaken or destroy Israel.

Some terrorists oppose minority groups. The Ku Klux Klan (KKK) was formed in the United States in the 1860s to prevent African Americans from voting. Later the KKK also targeted Catholics, Jews, and other groups.

Sometimes the rulers of a country practice another kind of terrorism by killing

their own citizens. Such rulers want to make people afraid to go against their power. Joseph Stalin of the Soviet Union and Saddam Hussein of Iraq ruled by terror.

Methods and Weapons

Terrorists often use bombs. They might carry bombs in cars, in packages, or on their bodies. They might also send bombs in packages. People called suicide bombers intend to die when they set off their explosives.

Terrorists can also release chemicals or other harmful substances. In 1995 a Japanese group released poison gas into the subway system in the city of Tokyo. Twelve people were killed. In 2001 five people died in the United States after someone mailed letters containing the disease anthrax.

Terrorists also kidnap or assassinate (murder) leaders. Or they might hijack, or seize, boats or airplanes. Sometimes they hold the passengers as hostages until their demands are met.

History

The word terrorism was first used in the French Revolution, which began in 1789. It described the way some of the revolutionary leaders punished those who opposed their actions.

In the late 1800s people called anarchists started to use terrorism. Anarchists want to do away with all government. An anarchist killed U.S. President William McKinley in 1901.

Terrorists crashed an airplane into the Pentagon, near Washington, D.C., on September 11, 2001. The Pentagon is the headquarters of the U.S. Department of Defense.

Anarchists also killed several European leaders.

In the 1900s more groups used terrorism than ever before. One reason is that deadly weapons became easier to get. Another reason is that airplane travel gave terrorists new ways to commit violence. Many of the groups that used terrorism had political goals. Others had very strong religious beliefs.

In September 2001 members of a group called al-Qaeda hijacked four airplanes in the United States. They crashed three of them into buildings. Their targets included the World Trade Center in New York City and the Pentagon, near Washington, D.C. It was the deadliest terrorist act up to that time. About 3,000 people were killed. Soon afterward U.S. President George W. Bush declared a “war on terror.”

Texas

Texas was an independent nation before becoming part of the United States. It had won freedom from Mexico in 1836. Nine years later on December 29, 1845, Texas was admitted to the Union. Its national flag then became its state flag. This red, white, and blue flag with a single star was the origin of the Texas nickname, the Lone Star State. Austin is the capital.

Geography

Texas is located in the south-central part of the United States. The river called the Rio Grande separates Texas from the country of Mexico on the southwest. The Gulf of Mexico lies to the south-

The Guadalupe Mountains National Park in western Texas features rugged mountains surrounded by a desert.

east. East of Texas are Louisiana and Arkansas. New Mexico is to the west, and Oklahoma is to the north.

The landscape of Texas consists mainly of plains and hills. The largest natural region is the coastal plain that covers southern and eastern Texas. It consists of flat, low prairies that stretch far inland from the Gulf of Mexico. In the central and west-central parts of the state are raised plateaus and hill country.

The Texas panhandle is a block of land that extends northward above the rest of the state. It is a flat, dry area with frequent sandstorms. The eastern edge of the panhandle and the north-central part of the state are lowland regions of

prairie and rolling plains. The most rugged, mountainous land in Texas lies in the far west.

People

During the late 20th century Texas was one of the fastest-growing states in the country. Texas is now second in population only to California. Three of its urban centers—Houston, Dallas, and San Antonio—are ranked among the country's 10 most populated cities.

Whites of European heritage represent more than half of the state's residents. Hispanic Americans, mostly of Mexican origin, make up almost a third of the population. About 12 percent of the people are African American.

Economy

The Texas economy is among the largest in the country. Major parts of the economy include commercial trade, real estate, and finance. Tourism is also valuable to the state. About 40 million people visit the state each year.

The state's top manufacturing industries are in the field of high technology. These industries include the production of

computers and electronic products.

Texas is the home of Dell, a major computer company. Another company in the state, Texas Instruments, is a major producer of electronic goods and military equipment. Oil production and the manufacture of chemical and petroleum (oil) products also contribute to the state's economy.

In agriculture, Texas ranks first in the country in the production of cattle. Other valuable farm products include cotton and chickens.

History

Native Americans lived in the Texas region before Europeans arrived. Early tribes included the Caddo, the Jumano, and others. Later the Comanche moved into the area.

The Spanish began to explore the Texas region in the early 1500s. In 1685 the French explorer Sieur de La Salle started a settlement along the Texas coast. It did not last long, but it did make the Spanish move more quickly to build settlements of their own. San Antonio was founded in 1718 and became the main settlement of Spanish Texas.

Sand dunes stretch along an island off the coast of Texas in the Gulf of Mexico.

When Mexico declared its independence from Spain in 1821, Texas became part of Mexico. During this period, Mexico allowed pioneers from the United States to enter the territory and set up colonies. Stephen F. Austin brought the first group of colonists to a site along the Brazos River. Austin is often called the Father of Texas.

Texans soon became unhappy with the Mexican government. In 1835 they revolted, and the next year they declared independence. In the most famous battle of the Texas war for independence, the Texans fought heroically to defend a mission called the Alamo. They lost at the Alamo, but they eventually defeated the Mexicans at a battle along the San Jacinto River. Texas became an independent republic in 1836. Sam Houston, the leader of the war, was elected its first president.

In 1845 Texas was admitted to the United States as the 28th state. Like other Southern states, Texas allowed slavery at that time. It joined the Confederacy during the American Civil War (1861–65). Although Texans fought for the South, the state itself was far removed from the major battlefields.

After the war Texas cowboys began driving cattle northward to markets or ranges. This vital industry led to the popular image of the cowboy in song, story, and film. The great cattle drives continued until about 1890.

The state's oil industry owes much to a place named Spindletop. Located near

Restaurants and cafés draw many people to the section of San Antonio, Texas, known as the River Walk.

Beaumont, Spindletop became the state's first great oil well in 1901. Numerous other wells followed. A huge oil field in eastern Texas was discovered in 1930.

On November 22, 1963, U.S. president John F. Kennedy was shot to death in Dallas. The vice president, Texas politician Lyndon B. Johnson, became the country's next president.

Another politician from Texas, George Bush, served as the country's president from 1989 to 1993. His son George W. Bush was elected president in 2000 and reelected in 2004. The Bushes were only the second father and son to both serve as president (the first were John Adams and John Quincy Adams).

Textile

Merchants in the country of Uzbekistan display many kinds of colorful cloth for sale.

The word textile commonly means woven or knitted cloth. Lace, felt, and many other kinds of cloth are considered textiles, too. Even nets, rope, and yarn may be called textiles. People use textiles to make clothing, towels, sheets, table linens, carpets, boat sails, flags, and many other things.

Textile production is one of the world's major industries. Factories throughout the world produce many tons of textiles every year. But people still create textiles in small shops and at home as well.

Making Textiles

To create textiles, people first make thread or yarn out of fibers. Some fibers are natural—for example, cotton, wool, linen, and silk. Others are artificial, or man-made—for example, nylon and polyester. Then people weave, knit,

knot, loop, or braid the thread or yarn together. These processes may be done by hand or by machine. People also may make textiles by pressing or gluing fibers together.

People often dye the thread or yarn before making it into textiles. They also may dye or print designs on cloth after it is made.

History

People have made yarn and woven cloth for thousands of years. Some of the world's oldest textiles have been found in ancient Egyptian tombs. Fragments of 3,000-year-old cloth also have been found in South America.

At first, people made cloth for themselves and their families. Eventually craftspeople took over the work and divided it into separate trades. Different workers spun the yarn, dyed it, and wove it into cloth. Other workers sold the cloth in shops. In the Middle Ages (about AD 500 to 1500) certain cities and regions became known for the kinds of textiles they made.

People made textiles by hand or with simple machines until the 1700s. Several inventions then made weaving faster. By the 1800s water and steam power ran many textile-making machines. Since that time, called the Industrial Revolution, textiles have been made mainly in factories.

Thailand

The local name for Thailand means “land of the free.” True to its name, Thailand is the only country in South-east Asia that was never ruled by European powers. Thailand’s capital is Bangkok.

Geography

Thailand is shaped like an elephant’s head. Narrow southern Thailand is the trunk, and the north is the head and the ear. Thailand shares borders with Myanmar, Laos, Cambodia, and Malaysia. The Andaman Sea, a part of the Indian Ocean, lies to the west. The Gulf of Thailand lies to the east.

Mountains and deep river valleys cover northern Thailand. The highest peak, Mount Inthanon, is 8,481 feet (2,585 meters) high. The mountains run down the western border into the south. The Chao Phraya is the country’s major river. It flows through plains in central

An unusual rock formation stands in a bay in southern Thailand.

Thailand. The northeast is a broad, flat area called the Khorat Plateau.

Winds known as monsoons affect Thailand’s climate. The winds bring a hot season, a rainy season, and a cool season.

Plants and Animals

Bamboo, coconut palms, mangroves, ferns, and mango and papaya trees grow in Thailand. Teak and other hardwood trees grow in the rain forests of the north.

Small numbers of wild elephants, rhinoceroses, and tapirs live in Thailand. Many monkeys and birds live in the forests. Lizards, frogs, snakes, and crocodiles are common.

People

Thai people make up most of the population. Chinese people form a smaller group. The country also has small

groups of Malays, Khmer, and others. Thai is the main language, but English is also widely spoken.

Almost all the people of Thailand follow Buddhism. Some people in the south, especially Malays, practice Islam. Most people live in rural areas.

Economy

Tourism is one of Thailand's largest industries. Manufacturing is another important part of the economy. Some of the major products are clothing, computers and other electronics, cement, sugar, and jewelry. Thailand is one of the world's largest producers of the metals tungsten and tin. The country's mines also provide coal, natural gas, and gems.

Many Thai people work in farming. The main crops include rice, sugarcane, cassava, and corn. Thailand also produces natural rubber, pineapples, and bananas. Pigs, chickens, and fish are other sources of food.

History

Thousands of years ago people in what is now Thailand grew rice and made metal tools. Between the AD 500s and 800s the Mon people set up small Buddhist kingdoms. By the 1100s the Khmer people of what is now Cambodia ruled parts of eastern Thailand.

Thai peoples moved into the area from China in about the 900s. In the 1200s they founded two kingdoms in what is now northern Thailand. The Sukhothai kingdom was founded after a local Thai ruler led a revolt against the Khmer. The

Tourists ride tame elephants in Thailand.

Lan Na kingdom was founded after another Thai ruler conquered a Mon kingdom.

In the 1300s the kingdom of Ayutthaya took the place of Sukhothai. The kingdom came to be known as Siam. Siam conquered Lan Na in the 1700s.

In 1782 a royal family called the Chakri dynasty came to power in Siam. During the 1800s Siam stayed independent while Europeans took over neighboring countries. In 1932 a military revolt ended the Chakri dynasty's absolute control over the country. Siam then became a constitutional monarchy. This means that the country still has a king from the Chakri dynasty, but his powers are limited. In 1939 the country became known as Thailand.

The military took control of Thailand in 1947. In 1973 students held protests that led to a more democratic government. But military leaders took power several times in the following years.

winds about 210 miles (338 kilometers) from west to east. After passing the city of Oxford, it flows through the countryside and then into London. The many landmarks along the Thames in London include the Houses of Parliament, Saint Paul's Cathedral, the Tower of London, and the Millennium Dome. The Thames empties into the North Sea.

People have lived in the Thames Valley for thousands of years. Before railways and good roads were built, the Thames was the area's main trade route. Over time many industries were set up along the banks. Today millions of people depend on the river for water and for sewage removal.

Thanksgiving

Thanksgiving is a yearly holiday marked by feasts and family gatherings. The day is celebrated in the United States, Canada, and other countries. It takes place on the fourth Thursday in November in the United States. In Canada it occurs on the second Monday in October. Both countries celebrate Thanksgiving with turkey feasts. In the United States, Thanksgiving Day parades and football games have become important traditions as well.

The Pilgrims of the Plymouth colony held the first Thanksgiving in 1621. They had landed in America on their ship the *Mayflower* in December 1620. Only half of them survived that first

A family prepares to eat a turkey dinner together at Thanksgiving.

winter. The next year, the harvest in the fall was good. To celebrate their harvest, the colonists and their Native American guests enjoyed a three-day feast.

Sarah Josepha Hale, the editor of a popular women's magazine, led the effort to have Thanksgiving become a national celebration in the United States. In 1846 she started sending letters to important politicians in order to achieve her goal. Finally, in 1863, President Abraham Lincoln proclaimed a national day of Thanksgiving. In December 1941 Congress officially named the fourth Thursday in November as Thanksgiving Day.

Theater

A theater is a place where people go to see plays and other performances. The word theater can also refer to everything involved in producing a live staged performance. The most common form of theater is a drama, or play. A drama is a story that is acted out for an audience.

Other kinds of theatrical productions may feature elements other than a story. They include musicals, puppet shows, circuses, operas, and ballets and other dance performances.

Inside the Theater

The part of a theater where the actors perform is called the stage. The most common kind, called a proscenium stage, is like a room with three walls. The audience sits in an auditorium and views the production as though looking through the fourth wall. Some theaters have a thrust stage, which extends partly into the seating area. The audience sits on three sides of the extended section of a thrust stage. In an arena stage the audience surrounds the stage. An arena stage is also called theater-in-the-round.

Other important parts of the theater include the backstage area and the dressing rooms. There is also a booth where technicians control the lighting and sound.

People in Theater

Many people work together to create theater. In a play actors have the most visible roles. The main people behind the scenes are the producer and the director. As the play's main businessperson, a producer obtains and manages all the money. The director decides how the play will be brought to life. This involves overseeing the actors and the behind-the-scenes crew. The director also runs rehearsals, or practices. A playwright writes the script, which contains the words the actors say.

Did You Know?

The word theater comes from a Greek word meaning "a place for seeing."

Did You Know?

Actors who played gods in ancient Greek plays were sometimes hung from a crane so they could “fly” across the stage.

The stage manager oversees all behind-the-scenes activity during the production. The set designer creates backdrops and furniture. The property master manages the small items, or props, used onstage. Lighting experts focus light on the stage to concentrate on certain activity and to set a mood. The makeup artist and costume designer help the actors look their parts.

Other types of theatrical productions may involve other people with special talents. For example, in puppet theater various people design, make, and operate the puppets. In productions featuring dance a person called a choreographer may make up all the dance steps and movements. Musicians and composers may be a key part of productions that use music.

History

Early Theater

In ancient Greece plays were performed as part of special festivals. The audience sat on seats carved into the side of a hill overlooking the stage. Some ancient Greek theaters could seat as many as 20,000 people.

In Europe during the Middle Ages (AD 500–1500) plays were often related to Christianity. At first they were performed in churches. Later they were performed outdoors—on the church steps, on decorated platforms, or sometimes even in wagons.

In the 1300s a type of theater called Noh was developed in Japan. Noh plays

combine words, music, and dance to portray legends. Men or boys play all the parts, including the female characters. The actors do not act out scenes. Instead they use their movements and appearance as symbols to suggest the story. A Noh play takes place on a thrust stage. The stage has four pillars topped by a curving temple roof.

The Renaissance (1300s to 1500s) was a period of great artistic creation in Europe. The large theaters built then set the pattern for today’s theaters. Grand spectacles staged in these theaters were usually for the upper classes. The common people went to see groups of traveling actors perform comic entertainment outdoors.

In the late 1500s many theaters opened in London, England. The most famous was the Globe Theater, where William Shakespeare staged many of his plays. The Globe had a thrust stage that extended halfway into an open court-

In the 1600s many of William Shakespeare’s plays were performed at the Globe Theater in London, England. The theater was torn down in the mid-1600s, but it was rebuilt on almost the same spot in the 1990s.

yard. The common people stood in the courtyard. Wealthier members of the audience sat in seats. During Shakespeare's time women did not perform in plays. The female characters were played by men or boys who dressed as women.

Modern Theater

In Japan in the 1600s a new form of drama called Kabuki appeared. It focused on singing, dancing, and mime (movement without words). Actors in a Kabuki play wear striking costumes and makeup. They use elaborate gestures to show strong emotions. Kabuki is performed on a thrust stage. A narrow, raised platform extends through the audience from the stage to the back of the theater. The actors use the platform for dancing and for important entrances and exits. A female dancer developed Kabuki. But after the 1650s only men acted in the plays.

Kabuki is related to a form of Japanese puppet theater called Bunraku. In Bunraku the performers move around large dolls to act out a drama. One of the performers chants the words of the story. Puppet theater also has a long tradition in many other countries, including Indonesia, Turkey, India, and China. In Europe puppet shows presented favorite characters in entertaining stories.

In Europe during the 1600s many theaters began to use the proscenium, or arch, stage. This is the type of stage seen in many modern theaters.

Several actors in Europe and North America in the 1700s and 1800s

Bunraku is a Japanese form of puppet theater. The people who move the puppets appear on the stage with the puppets.

developed new ideas about acting. Before then actors often read their parts as if they were making a speech. The English actor David Garrick developed a more natural acting style. He delivered his lines in the spirit of the character he was playing.

In the 1800s New York City became the theatrical center of the United States, as London was in England. In the 1900s people began performing theater in a greater variety of places. More cities and towns around the world built new theaters.

Thistle

Thistles are prickly plants that most people think of as weeds. But some kinds of thistle have nice flowers, and people grow them as garden plants. One type of thistle is the national symbol of Scotland.

Thistles can grow to more than 8 feet (2.4 meters) tall. They usually have prickly leaves. The stem and flowers can also be prickly. The leaves usually have ragged edges. They are green or blue green and are sometimes covered with fine white hairs.

Thistles have many tiny flowers growing together in tight clusters. The flowers are packed so closely that the clusters look like single flowers. Most types of thistle can grow dozens of these flower clusters on one plant. The flowers are mostly pink, purple, or yellow. They produce feathery seeds that scatter in the wind.

Thistles grow mostly from seeds. Some thistles also can grow from small pieces of root in the soil. This makes thistles

The “flowers” of a thistle are actually clusters of many tiny flowers.

hard to remove from farm fields. Thistles are also hard to get rid of because their roots grow deep into the soil. Also, livestock and other animals do not eat thistles because they are so prickly.

Thorpe, Jim

Jim Thorpe was one of the greatest all-around athletes in history. He excelled at football, baseball, basketball, boxing, lacrosse, swimming, and hockey.

James Francis Thorpe was born on May 28, 1888, in Indian Territory, which is now Oklahoma. He was mostly of Native American descent. Thorpe attended Carlisle Indian Industrial School in Pennsylvania. There he played

football under the famous coach named Pop Warner.

In 1912 Thorpe went to the Olympic Games in Stockholm, Sweden. He won gold medals in the decathlon and the pentathlon. (The decathlon is a track-and-field competition with 10 events. The pentathlon has five events.) But in 1913 Thorpe’s medals were taken away from him. It was found that Thorpe had played professional baseball in 1909 and 1910. A rule stated that professional athletes could not participate in the Olympics.

Thorpe played major league baseball from 1913 through 1919. Then, from

Jim Thorpe was a star player in the early days of American professional football.

1919 through 1926, he was an early star of American professional football. In 1920–21 he served as the first president of the organization that is now called the National Football League.

Thorpe died in Lomita, California, on March 28, 1953. The International Olympic Committee returned Thorpe's Olympic gold medals to his family in 1983.

Tibet

Tibet is a part of western China. It has some of the world's tallest mountains. Tibet is so high that it is often called the Roof of the World. The capital is Lhasa.

Most of Tibet is on a piece of land called the Plateau of Tibet. The plateau is a raised flat area about 15,000 feet (4,600 meters) above sea level. The Himalaya Mountains are to the south. Mount Everest, the world's highest peak, is on the border of Tibet and the country of Nepal. Tibet's climate is cold and dry.

Almost all the people of Tibet are Tibetans. Some Chinese also live there. Tibet-

ans speak the Tibetan language and practice their own form of Buddhism. The main leader of Tibetan Buddhism is called the Dalai Lama.

The economy of Tibet is based on farming. Tibetans raise yaks, horses, cows, sheep, and goats. They grow barley, wheat, millet, buckwheat, and potatoes. Tibetans also make handicrafts such as carpets, blankets, jewelry, and wooden bowls. A few factories produce textiles, machinery, chemicals, and other goods.

Tibet became a powerful Buddhist kingdom between the AD 600s and 800s. It came under the rule of the Mongols in the 1200s. In the 1700s the Qing, or Manchu, Dynasty of China took over Tibet.

The Qing Dynasty lost power in 1912. Then the Dalai Lama ruled Tibet. But in 1950 China again took control. The Tibetans rebelled against the Chinese in 1959, but they were defeated. The Dalai Lama fled to India. In the 1960s and 1970s the Chinese closed Buddhist monasteries and temples and destroyed

The Potala Palace in Tibet was once the home of the Dalai Lama.

religious writings. In the 1980s China began to allow some freedom in Tibet.

Tick and Mite

Ticks and mites are tiny animals that are found all over the world. They are related to spiders. Many ticks and mites are parasites. This means that they live on or inside other animals, which are called hosts.

Ticks can be more than an inch (2.5 centimeters) long, but most are much smaller. They can be hard-bodied or soft. Most hard ticks live in fields or woods. Soft ticks generally live in the host's home or nest.

Mites live in water and soil, on plants, and as parasites on animals. Some are so small that people can see them only with a microscope. Others can be 0.25 inch (6 millimeters) long.

Ticks and mites develop in stages from an egg into an adult. Hard ticks start and end each stage on the ground. At the end of each stage they attach to a host, such as a rodent, dog, or person. They suck the host's blood for a few days and then drop to the ground. They can go months without a meal as they wait for a host.

Ticks and mites can be very harmful. They can spread diseases to people, animals, and plants. For example, the deer

An American dog tick perches on grass while it waits for a chance to attach itself to a dog or other mammal. The American dog tick can give humans a serious disease called Rocky Mountain spotted fever.

tick carries Lyme disease. Hard ticks can also give off nerve poisons that can paralyze or kill the host. Some mites cause itching and skin problems.

Tide

Along the coasts of every ocean on Earth the water level changes on a regular basis. This movement is known as the tide. The greatest height reached as the water rises is known as high tide. The lowest level reached as the water falls is known as low tide.

Tides take place in all bodies of water. In some waters, however, the change is so slight that tides go unnoticed. Tides are easier to see where an ocean meets land along seacoasts and in bays. There are

usually two high and two low tides per day at any given place. The times at which they happen, however, change from day to day. The average amount of time between two high tides is 12 hours and 25 minutes.

Tides are caused by a natural force called gravity. Because of gravity, all

Both the sun and the Moon pull on Earth's ocean water with a natural force called gravity. This pull creates tides. As the sun, Moon, and Earth move in space, they sometimes form a straight line, shown at top. This arrangement creates high tides that are higher than usual. It also creates low tides that are lower than usual. At other times the sun, Earth, and Moon are positioned like the corner of a square, shown at bottom. This arrangement evens out the tides more. It creates high tides that are less high than usual and low tides that are less low than usual.

bodies in the universe pull on each other. The sun and the Moon both pull on Earth, but the Moon has a greater influence because it is closer to Earth than the sun. As the Moon pulls on Earth it makes the water move. On the side of Earth near the Moon, the water builds up in a wave. Another wave forms on the other side of Earth. This is because the Moon is pulling Earth away from the water on that side. These waves result in high tide. As Earth rotates and the Moon moves around Earth, the tides change as well. Because the Moon moves around Earth in a regular path, the cycle of the tides follows a regular pattern.

Tierra del Fuego

Tierra del Fuego is a group of islands at the southern tip of South America. About two thirds of the islands are in Chile, and the rest are in Argentina.

The name Tierra del Fuego is Spanish for “land of fire.” The explorer Ferdinand Magellan named the islands. When he sailed around the tip of South America in the 1500s, he saw many fires built by Indians along the coast.

A waterway called the Strait of Magellan separates the islands from mainland South America. The main island, called Tierra del Fuego, is triangular. The southern and western parts of the islands are mountainous.

Forests of beech trees grow in the middle of the main island.

Chile's only oil field is in the northern part of Tierra del Fuego. The islands have some textile and electronics companies. There is some logging in the forests. Tourism is a valuable industry, too.

The first people to live on the islands were the Ona, Yahgan, and Alacaluf Indians. Magellan sailed past the islands in 1520. Gold was discovered on Tierra del Fuego in the 1880s. Then people from Argentina and Chile started moving to the islands. Oil was found in the area in 1945.

Tiger

The tiger is the largest of the cats. Like lions, tigers are very strong and fierce hunters. Tigers are found in the wild only in parts of Russia, China, and South and Southeast Asia. They live in forests, grasslands, and swamps. The scientific name of the tiger is *Panthera tigris*.

Physical Features

Male tigers can grow to more than 3 feet (1 meter) high and 10 feet (3 meters) long, including the tail. They usually weigh between 350 and 640 pounds (160 to 290 kilograms). Their fur can range from light yellow on the belly to deep yellow or orange on the back. Dark stripes cover the head, body, and legs. There are also black rings on the tail.

There are five different kinds of tiger. The best known is the Bengal tiger, found mainly in India. The rare Siberian tiger is larger and has longer, softer fur. The Bengal and Siberian tigers are the kinds most often seen in zoos.

Behavior

Tigers hunt alone at night. They prey on animals such as deer and wild hogs. Tigers generally avoid large animals such as elephants and bears. They also try to stay away from people. But sometimes they attack people to save themselves or because they cannot find other food.

A tiger crouches in the grass and watches its prey before attacking it. It grabs the prey with its paws and bites the animal's neck. Then the tiger drags the dead animal to a safe place and eats it over several days.

Siberian tiger

Life Cycle

Tigers normally come together only to mate. About three months after mating, the female has two or three cubs. She looks after them for about two years and teaches them to hunt. Tigers live about 11 years.

Tigers and Humans

Tigers are endangered, or in danger of dying out. People have moved onto land where tigers once lived, destroying their homes. Plus, people hunt tigers for sport and for their skin. Many countries now have laws to protect tigers.

Tigris River

The Tigris River of southwest Asia is 1,180 miles (1,900 kilometers) long. It begins in the mountains of eastern Turkey. It then touches the northeastern border of Syria and crosses Iraq. In southeastern Iraq the Tigris joins the Euphrates River. The two rivers together

form the Shatt Al-'Arab. That waterway empties into the Persian Gulf.

The land that the Tigris flows through gets little rainfall. It is also very hot. But farmers are still able to grow crops there. They water their crops using water from the Tigris and the Euphrates. The watering methods they use are called irrigation.

Some of the earliest known civilizations began on the land between the Tigris and the Euphrates. The ancient Greeks called the area Mesopotamia. The name means “land between the rivers.” Several ancient cities were built along the Tigris. One was Assur. That city gave its name to the empire called Assyria. Nineveh was another ancient city on the river. It was Assyria’s capital. The main modern cities on the Tigris are Baghdad and Mosul, both in Iraq.

Time

People use the idea of time to measure how long it takes for things to happen. They also use time to describe how long ago things happened in the past. Time helps to describe when things may happen in the future as well.

Units of Time

People divide time into days and hours. There are 24 hours in one full day and night. Hours are divided into minutes and seconds. There are 60 minutes in an hour and 60 seconds in a minute.

People measure longer periods of time by years. There are 365 or 366 days in one year. A year is divided into 12 months. Months have from 28 to 31 days.

Time Zones

At any time, only part of Earth experiences daylight. It is nighttime for the rest of the planet. This means that it cannot be the same time of day in every part of the world. For this reason people have divided the globe into 24 sections called time zones. At most places inside a time zone, it is the same time of day.

Imaginary lines separate all the time zones. The lines run from the North Pole to the South Pole. The first time zone begins at 0° longitude, or the prime meridian. This imaginary line runs through Greenwich, England.

When people cross one of the imaginary lines, they enter a new time zone. The time of day changes by one hour. If they cross into a time zone to the west, it is one hour earlier. If they cross into a time zone to the east, it is one hour later. (In a few places in the world, the time changes by only a half hour.)

The imaginary lines dividing the time zones are not always straight. They often bend west or east. This allows whole countries or regions to be within a single

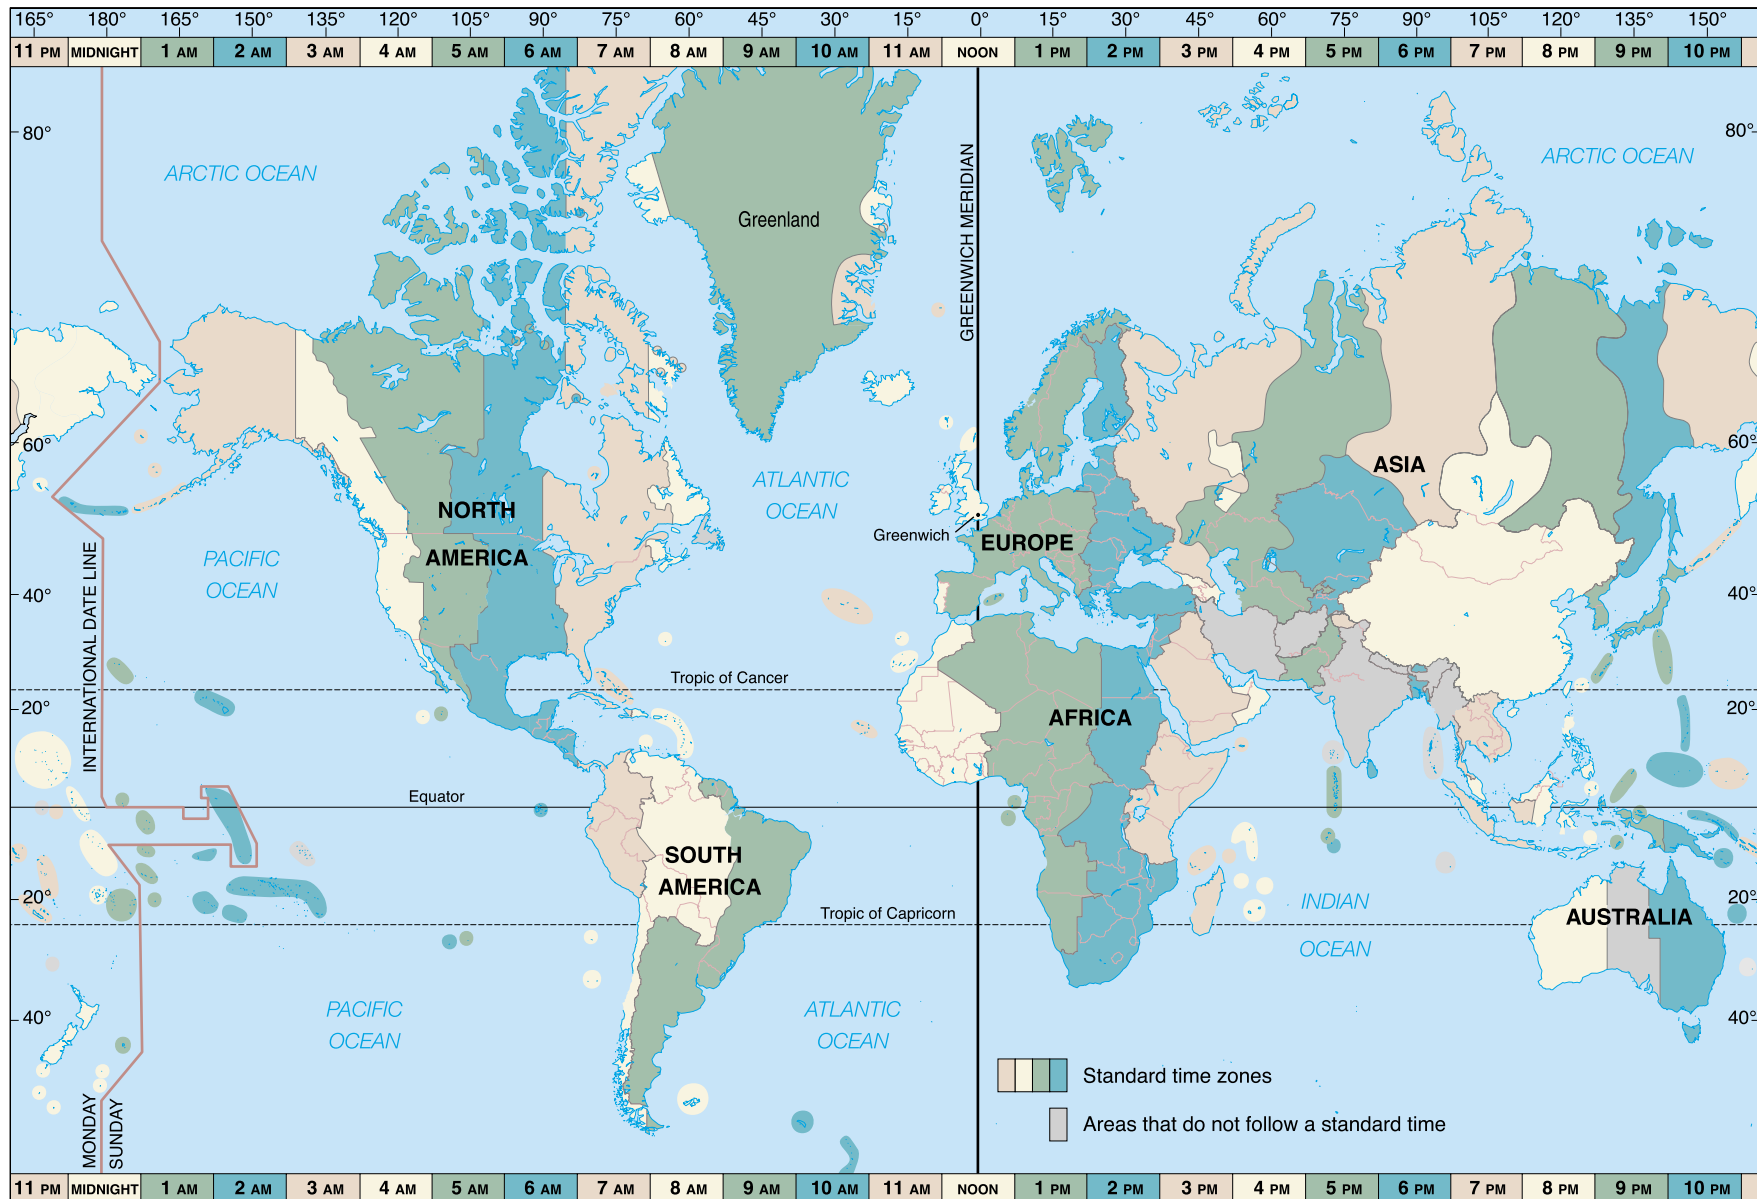

A stopwatch measures the minutes and seconds an athlete takes to complete a run. People use many different types of watches, clocks, and calendars to keep track of time.

time zone. However, large countries—such as the United States and Russia—are divided into several time zones.

On the other side of Earth from the prime meridian is the International Date Line (IDL). It runs through the Pacific Ocean at about 180° longitude. When travelers cross the IDL going from west to east, they gain a whole day on the calendar. For example, if they start traveling on January 2, the date changes to January 1 when they cross the IDL. When people travel from east to west across the IDL, they move a day forward in time.

History

Ancient people measured time by looking at the sky. They saw the sun rise and set and the Moon grow full. They watched the stars and the other planets change position. They also experienced the days becoming shorter and longer and the cycle of the seasons.

Earth is divided into 24 time zones. The boundary lines between the zones are not always straight because every country makes its own rules about which time zones it wants to be in.

People in ancient Egypt, Mesopotamia, Central America, and other places created calendars to keep track of the passing days. The ancient Egyptians also invented a form of clock called a sundial. Sundials cast shadows that move as the day passes.

Eventually people all over the world had developed many types of clocks and calendars to keep track of time. But the time was different in every city. In the 1800s some people thought there should be one system of measuring time so that everyone could agree about what time it is. This was important for such things as making schedules for trains and knowing when to go to school. In 1884 countries throughout the world adopted the time zone system that is still in use.

Tiranë

Population
(2001 census)
343,078

Tiranë is the capital of Albania, a country in southeastern Europe. It lies on the Ishm River. It is Albania's largest city.

People crowd Tiranë's main square at night.

Tiranë is Albania's main center of business and industry. However, in the early 21st century the country's economy was one of the poorest in Europe. Factories in Tiranë make clothing, processed foods, leather, and other products.

A Turkish general founded Tiranë in the early 1600s. Albania was then part of the Turkish Ottoman Empire. Tiranë gradually grew into a busy trading center.

Albania became an independent country in 1912. Tiranë became its capital in 1920. Between 1939 and 1944, during World War II, Italian and then German forces controlled the city.

Between 1946 and the early 1990s, Albania was a Communist country. Protests in Tiranë helped to bring an end to Communist rule. However, the end of Communism did not bring about a lasting peace. In the later 1990s the city was the site of several violent political protests.

Titanic

The passenger ship called the *Titanic* sank in 1912, on its first voyage.

On its first trip across the Atlantic Ocean, a passenger ship called the *Titanic* struck a huge iceberg. The ship sank on April 15, 1912, killing more than 1,500 people. It was one of the most famous disasters of the 20th century.

Before there were airplanes, people crossed oceans on ships called ocean liners. The *Titanic* was one of the largest ocean liners of its time. It was more than 880 feet (270 meters) long and had nine decks, or floors. The hull, or body, was made of steel and divided into 16 compartments. Some people said that the *Titanic* was unsinkable.

On April 10, 1912, the *Titanic* set out from Southampton, England. It was bound for New York City. Some of the passengers were rich people on business or pleasure trips. Others were poor European emigrants who were looking for a better life in North America.

Lookouts saw an iceberg at 11:40 PM on April 14. The ship could not move out

of the way fast enough. The hull was torn apart and the ship began to fill with water. At 2:20 AM the next day, the *Titanic* sank.

About 705 people escaped in lifeboats. However, there were not nearly enough lifeboats for the 2,224 people that the ship carried. Governments strengthened safety rules for ships after the disaster.

In 1985 deep-sea explorers found the remains of the *Titanic* at a depth of 13,000 feet (4,000 meters) near the Canadian island of Newfoundland. Underwater vessels explored the ship and brought pieces of wreckage to the surface.

Titans

In ancient Greek mythology the Titans were giants who once ruled the world. According to legend, they were the children of Uranus (Heaven) and Gaea (Earth). Uranus hated his children, and he shut them up in the Earth. The Titans rebelled against him and took power. Cronus (Saturn) then became the ruler of the Titans.

Later Cronus' son Zeus led a long war that forced the Titans from power. Zeus then became the chief god.

Other important Titans included Rhea, who was the wife of Cronus and the mother of Zeus. The Titan called Hyperion was the father of the sun, Moon,

The Titans were a group of giants in the myths of ancient Greece. Among the more important Titans were Atlas, Hyperion, Prometheus, Cronus, and Rhea.

Tlingit

The Tlingit are Native Americans of southern Alaska and northern British Columbia, in Canada. They live along the coast and on nearby islands in the Pacific Ocean.

The Tlingit traditionally got much of their food by fishing. They also hunted seals and sea otters and gathered wild berries and roots. The Tlingit used cedar wood from nearby forests to build houses. Their houses were large enough for several families.

In 1741 Russian explorers arrived in Tlingit lands. By the end of the 1700s Russian traders had set up a fort in Tlingit territory. Many Tlingit fell ill with deadly diseases carried by the Russians and other European settlers. In the 1830s smallpox killed about half of the Tlingit.

In 1867 Russia sold Alaska to the United States. Then U.S. settlers began taking over the tribe's land. More settlers arrived after gold was discovered in the area in 1880.

In 1912 the Tlingit helped to form a group called the Alaska Native Brotherhood. This group worked to take back the lands of southern Alaska's Indians.

Tlingit gather in Sitka, Alaska, in 2004 to remember a battle with Russian soldiers that took place in 1804.

In 1971 the U.S. government returned 44 million acres (18 million hectares) of land to the Tlingit and other tribes.

At the end of the 20th century more than 9,000 Tlingit lived in the United States. Another 1,000 Tlingit lived in Canada.

Toad

Toads are small animals often confused with frogs. Toads, however, have dry, rough skin and short legs. Frogs have moist, smooth skin and longer legs.

Toads can be found in all but the coldest parts of the world. They are amphibians, meaning that they live on both land and water. However, toads generally spend more of their time on land than they do in the water.

Toads have squat, plump bodies. They do not have tails. They range from about 1 to 10 inches (2.5 to 25 centimeters) long. Their skin is usually brownish olive, often with some darker spots. One group, called variegated toads, has large back feet and are bright yellow, red, or green with black spots.

Toads are typically covered with bumps that look like warts. When a toad feels threatened it releases poison from the bumps. The poison can sting an enemy's eyes and mouth. The poison of some toads is strong enough to kill their enemies.

Toads are active mainly at night. They spend the day underground or hidden under leaves or stones. In the winter most toads enter a state of inactivity called hibernation. Some toads are inactive during hot and dry weather as well.

Toads move by short hops or by walking. They catch prey with their long, sticky tongues. Toads generally eat insects and worms. Some large toads, however, eat frogs and small rodents.

The natterjack toad lives in northern Europe.

Some toads, such as the Oriental fire-bellied toad, can be quite colorful.

Toads lay their eggs underwater. After a few days the eggs hatch into small, fish-like creatures called tadpoles. Tadpoles have tails and gills. The gills are structures that help them breathe underwater. Tadpoles eventually lose their tails and develop lungs and legs. They can then leave the water to live on land.

Tobacco

Tobacco is a plant that is grown for its leaves. The dried leaves are usually made into cigarettes, cigars, or pipe tobacco. Users light these products and breathe in the smoke. Tobacco also may be chewed or taken in the form of a powder.

All these products deliver a habit-forming drug called nicotine to the user. This drug makes it hard to stop using tobacco. But using tobacco can cause serious health problems, including lung cancer, breathing disorders, and heart disease.

Native Americans were the first people to grow tobacco plants. They used tobacco in ceremonies and as medicine. In the late 1400s and early 1500s European explorers learned about tobacco from the Native Americans. The Europeans established large farms called plantations in the Americas to grow the crop. They also brought tobacco back to their home countries.

Today people in many parts of the world grow and use tobacco. However, some governments have tried to limit its use. For example, some places do not allow smoking in public buildings.

Tobacco plants produce large leaves. The leaves are dried after they are picked.

Tohono O'odham

The Tohono O'odham are Native Americans who live in southern Arizona and northern Mexico. They are often called the Papago. The Tohono O'odham are related to the Pima people. They may be descendants of the ancient Hohokam Indians.

The Tohono O'odham traditionally built houses from mud and brush in the desert. Their name means “desert people.” Because their land was very dry, they moved in different seasons to make sure they had enough water. Summer rains provided water to grow crops. The tribe grew corn, beans, squash, and cotton. When the rains stopped, the

A photograph from the early 1900s shows a Tohono O'odham woman carrying a basket on her head.

Tohono O'odham moved to winter villages in the mountains. There they got water from springs. For food, they hunted wild animals and gathered wild plants.

Spanish explorers arrived in the lands of the Tohono O'odham in the late 1600s. The Spanish taught the tribe how to grow wheat and raise cattle and horses.

The Tohono O'odham of Mexico eventually lost much of their land to settlers and ranchers. The Tohono O'odham of the United States were given several reservations. The Tohono O'odham Reservation in Arizona is the country's second largest reservation. In the late 20th century there were more than 17,000 Tohono O'odham in the United States. A few hundred lived in the Mexican state of Sonora.

Tokyo

Population

(2008 estimate), city, 8,731,000;
(2007 estimate), urban area, 35,700,000

Tokyo is the capital of Japan, an island country in eastern Asia. It is located on Japan's main island, Honshu. The city

Shibuya is a lively shopping district in Tokyo.

lies on Tokyo Bay, which is part of the Pacific Ocean. Tokyo is one of the largest cities in the world. It is Japan's center of industry, culture, and education.

The city of Tokyo is part of the huge Tokyo metropolitan area. It includes the countryside around Tokyo as well as several islands. The Tokyo metropolitan area also includes three other major cities—Yokohama, Kawasaki, and Chiba.

Cityscape

Tokyo has several distinct districts. At the heart of the city is the Imperial Palace, the home of the emperor of Japan. Many other national government buildings are in the nearby Kasumigaseki district. Marunouchi is a business district. Shinjuku is a center of entertainment and shopping. The Ginza district is world famous for its expensive stores.

Economy

Tokyo is Japan's main center of manufacturing, banking, and business man-

agement. Many companies have headquarters in the city. Publishing is a leading industry. Factories in Tokyo make such products as computers, televisions, and other electronics. Factories in the metropolitan area produce metals, chemicals, and machinery.

History

In ancient times the city was named Edo. It was a small village until the Tokugawa family began ruling Japan in the early 1600s. The Tokugawa rulers made Edo their headquarters. The city then grew greatly. In the 1800s more than a million people lived there. However, Japan's official capital was the city of Kyoto.

The emperor Meiji began ruling Japan in 1868. Edo was then renamed Tokyo and made the official capital. Under Meiji's rule the city was made more modern.

An earthquake severely damaged Tokyo in 1923 and killed at least 100,000 people. Bombing destroyed much of the city in the 1940s, during World War II. But Tokyo was soon rebuilt. In the second half of the 1900s it developed into an industrial center. It also became known for its many modern skyscrapers.

Tolkien, J.R.R.

J.R.R. Tolkien wrote popular books of fantasy fiction. The most famous of his

J.R.R. Tolkien

books are *The Hobbit* and *The Lord of the Rings*.

John Ronald Reuel Tolkien was born on January 3, 1892, in South Africa. At age 4 he moved with his family to Great Britain. Tolkien graduated from Oxford University in 1915. Soon afterward he left to fight for the British in World War I.

In 1925 Tolkien began teaching at Oxford. His classes dealt with the roots of the English language. He studied old fables, myths, and legends. During this time Tolkien began writing fantasy stories. Part of this writing included making up an entire language called Elvish. The characters called elves in Tolkien's stories speak this language.

Tolkien published *The Hobbit* in 1937. He wrote it partly to amuse his four children. The main character of the book is a short, furry-footed creature called a hobbit. The story takes place in a fantasy world called Middle-earth.

The Lord of the Rings, published in 1954 and 1955, also takes place in Middle-earth. This novel is sometimes divided into three parts: *The Fellowship of the Ring*, *The Two Towers*, and *The Return of the King*.

Tolkien died on September 2, 1973. He had started another book about Middle-earth, called *The Silmarillion*, but did not finish it. Tolkien's son Christopher published this book in 1977.

Toltec

The ancient Toltec people developed a great civilization in what is now central Mexico. From the AD 900s to the 1100s they were the most powerful Native Americans in the region.

The capital city of the Toltec was Tula. Historians do not know exactly where Tula was. However, they know that it

Stone columns that stand 15 feet (4.6 meters) high were carved by the Toltec in Mexico.

was in the area of what is now Mexico City. As many as 40,000 people lived in Tula.

The Toltec built houses out of clay bricks. These bricks kept the heat out in the summer and the cold out in winter. In Tula the Toltec also built great pyramids and palaces.

The Toltec farmed for most of their food. They grew corn and squash. They also grew cotton and plants that they used to make medicines.

Did You Know?

The Toltec are known for the art objects they made from stone and metal.

The Toltec settled in what is now central Mexico in about AD 900. In the 1100s other Indian groups began invading Toltec lands from the north. The invaders were called the Chichimec. The Chichimec destroyed Tula in about 1160.

The Chichimec took on many Toltec ways of life. Among the Chichimec groups were the Aztec. They created the next great Indian civilization in central Mexico.

Tomato

Tomatoes are commonly called vegetables, but they are actually fruits. They are eaten raw or used in cooking.

Canned tomatoes and tomato juice are also popular. Tomatoes are grown in all mild regions of the world. They belong to the nightshade family.

Tomatoes come in different sizes and shapes. Some small varieties are called cherry tomatoes or grape tomatoes.

Tomato plants generally have many spreading branches. The leaves are hairy and have a strong smell. The flowers are yellow and hang in clusters. The fruit is about 0.5 to 3 inches (1.3 to 7.6 centimeters) across. It can be round or oval or shaped like a pear. When ripe, the fruit is soft, juicy, and usually red or yellow. Tomatoes contain many small seeds surrounded by jellylike pulp. This pulp contains most of the tomato's vitamin C.

Tomato plants first grew wild in the Andes Mountains of South America. The Spanish brought tomatoes to Europe after finding them growing in the Americas. At first Europeans grew tomatoes only for decoration. They thought that tomatoes were poisonous because they are related to the deadly nightshade plants. Tomatoes did not become popular in the United States until the early 1900s.

Tonga

Schoolchildren in Tonga raise their hands to answer the teacher's question.

The country of Tonga is made up of about 170 islands in the southern Pacific Ocean. The largest island is Tongatapu. It is where the capital, Nuku'alofa, is located.

Tonga is a part of the Pacific region called Oceania. People live on only about 40 of Tonga's islands. Some islands are the peaks of underwater volcanoes. Others are atolls, or coral reefs that surround a pool of water. Tonga's climate is warm and rainy.

Rain forests grow on the volcanic islands. Mangrove trees grow in swampy areas. Tonga's birds include doves, kingfishers, cuckoos, and shrikes. Large fruit bats, called flying foxes, live on Tongatapu.

Almost all the people of Tonga are Polynesians, the native people of eastern Oceania. The main languages are Tongan and English. Nearly all Tongans are Christians. About two thirds of the people live on Tongatapu. Fewer than half of the people live in cities.

The economy of Tonga is based on farming and fishing. Farmers grow squash, coconuts, cassava, yams, bananas, and vanilla beans. They also raise pigs, goats, and cattle. Tourism is another important part of the economy.

People have lived on the islands for at least 3,000 years. Kings and queens have ruled Tonga since the AD 900s.

Dutch and British explorers visited the islands in the 1600s and 1700s. Christian missionaries arrived in the 1800s. In 1900 Tonga gave control of its foreign affairs to Great Britain.

Tonga became independent of Britain in 1970. In the 1990s some Tongans began asking the king to make the country a democracy.

Tongue

The tongue is an organ, or body part, in the mouth. It is made up of a group of muscles. Most vertebrates, or animals with a backbone, have a tongue.

The tongue is firmly attached to the bottom of the mouth. This attachment keeps the tongue from being swallowed. The underside of a mammal's tongue is smooth. The top of the tongue is rough and bumpy. These bumps are called papillae. The papillae contain taste buds. They also produce some of the fluid in saliva, a sticky liquid that keeps the mouth moist.

The Human Tongue

The drawing on the top shows papillae on the tongue. The drawing on the bottom shows how the tongue fits into the mouth.

Eating and Tasting

In many animals the tongue helps in chewing and swallowing food. Papillae help to grip and hold food. The front muscles of the tongue move food around and over the teeth during chewing. The back muscles of the tongue help in swallowing. They push chewed food to the back of the mouth and down the throat.

The tongue is also responsible for the sense of taste. The taste buds contain special cells that send information about foods to the brain. These special cells each respond to a particular kind of taste. Humans can sense five basic tastes: salty, sweet, sour (acid), bitter, and umami. Umami represents the taste of certain chemicals called amino acids.

People are born with about 10,000 taste buds, and there may be 50 to 150 cells in each bud. As people age, the number of taste buds may drop to 5,000. This may explain why some foods taste stronger to young people.

Other Uses

Tongues have many other uses. The human tongue plays an important part in speaking. It forms and shapes the sounds that make up language. Dogs and cats use their tongues to clean themselves. Frogs use their tongues to catch insects and other small animals for food. Snakes and other reptiles flick out their tongues to collect scents in the air.

Tonsillitis

Tonsillitis is an infection of the tonsils. The tonsils are oval-shaped lumps of tissue in the throat. Usually they help protect the body against disease. But sometimes they become infected themselves. An infection is an attack by tiny germs that cause disease. Children get tonsillitis more often than adults.

The germs that cause tonsillitis are called bacteria and viruses. Infected tonsils become large and red. A person with tonsillitis first feels a sore throat. The sore throat sometimes makes it painful to talk or to swallow. The person might also get a fever. Glands on the sides of the neck might swell.

Tonsillitis spreads easily, especially by coughs and sneezes. Avoiding people with tonsillitis reduces the chance of infection. Frequent hand washing also helps. Washing the hands can kill the bacteria and viruses that cause tonsillitis.

The treatment of tonsillitis depends on the cause. If bacteria are the cause, the doctor gives the person a medicine called an antibiotic. If a virus is the cause, the tonsillitis usually has to clear up on its own. Tonsillitis generally lasts less than a week. During that time the person should rest and drink lots of liquids. In some severe cases of tonsillitis, a doctor has to remove the tonsils.

Topeka

Population
(2000 census)
122,377;
(2007 estimate)
122,642

Topeka is the capital of the U.S. state of Kansas. The city lies on the Kansas River.

Many people in Topeka work for the government or in trade, health care, or other service industries. The city is an important market for wheat grown in the surrounding area. The leading manufacturing industries include printing, food processing, and making tires.

In its early history Topeka played a role in the U.S. conflict over slavery. A group of people who opposed slavery founded the city in 1854. Several battles took place there. Groups fought over whether

A doctor examines a girl's throat. When a child has a sore throat, the doctor often checks for tonsillitis.

A sculpture honoring pioneers stands near the Kansas state Capitol in Topeka, Kansas.

Kansas should permit slavery when it became a U.S. state. In 1861 Kansas became a state that did not allow slavery. Topeka was made the capital.

In the 1860s Topeka became the headquarters for the building of a large railway. The railway brought jobs to the city and helped it grow.

In 1951 the Kansas River overflowed and flooded Topeka. A tornado damaged much of the city in 1966.

Torah

A holy text of Judaism, the Torah is made up of the first five books of the Hebrew Bible (which Christians call the Old Testament). These books are Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.

The Torah begins with the story of the creation of the world. It goes on to

explain and interpret the laws of God, including the Ten Commandments. Jews believe that God gave the laws of the five books to the prophet Moses on Mount Sinai.

All Jewish synagogues, or places of worship, keep a copy of the Torah. The copy is written by hand on parchment scrolls (rolled-up sheets of animal skin). During most synagogue services a member of the congregation reads from the Torah. Most synagogues read the entire Torah in one year.

In Hebrew the word Torah means “to teach” or “to show the way.” In that broad sense, all Jewish teachings—including the Hebrew Bible, the Talmud, and unwritten Jewish traditions—can be considered part of the Torah.

Toussaint-Louverture

Toussaint-Louverture

Toussaint-Louverture was born a slave but became a great military leader. He led the fight for the independence of Haiti. Haiti occupies part of the island of Hispaniola in the West Indies.

Early Life

François Dominique Toussaint was born in about 1743 in Saint-Domingue (now Haiti). He was black, like most of the other slaves in Saint-Domingue. Although he was a slave, he learned some French and Latin. As a young man he supervised the work of other slaves on the large farm where he lived. He became free in 1777.

Rebel Leader

During most of Toussaint's life, France controlled Saint-Domingue. But the slaves greatly outnumbered the French people living there. In 1791 the slaves

rose up in rebellion. Toussaint formed his own rebel army. He soon became known as Toussaint-Louverture. This was because he easily found openings in the enemy's defenses. ("Louverture" comes from the French word for "opening.")

France fought to end the rebellion. But by 1801 Toussaint had taken over all of Hispaniola. He freed everyone on the island who was still a slave. He then made himself governor-general for life.

Capture and Death

Toussaint ruled until 1802. In that year France sent troops to take back control. Toussaint's forces were outnumbered. In 1803 the French captured Toussaint and sent him to France. He died in a French prison on April 7, 1803.

Another black leader named Jean-Jacques Dessalines continued the fight against France. His forces won independence for Saint-Domingue—renamed Haiti—in 1804.

Toy

Children everywhere enjoy playing with toys. A toy can be a simple ball, a game, or an expensive machine that uses the latest technology. Years ago most toys were made from wood and cloth. Today the most common material is plastic.

Toys date back to ancient times. Scientists often find toys when they dig up old ruins. These include ancient balls,

Did You Know?

Teddy bears have been popular toys for more than 100 years. They are named after Theodore "Teddy" Roosevelt, who was U.S. president from 1901 to 1909.

Simple wooden blocks decorated with numbers and letters are a popular toy.

dolls, tops, and toy wagons and boats. They have also dug up game pieces. People have played games similar to chess, checkers, and backgammon for thousands of years.

Many toys, from both ancient and modern times, look like objects from the adult world. As children grow they often imitate adults in their play. They enjoy toys modeled after things that adults use in everyday life. A child in ancient Egypt might have played with a small wooden camel. A child in today's world might have a toy car or a toy telephone.

The modern toy industry is a very big business. Simple toys are still common. But many companies produce toys that run on batteries. Other toys use the latest electronic and computer technology.

The toy business is challenging, however, because fads quickly come and go. A toy loved by children today may soon lose popularity. Safety is another concern for toy makers. Most toy packaging

includes safety warnings. These messages warn about such things as small objects that a very young child could swallow.

Electronic Games

Track and Field

Contests of running, jumping, and throwing are called track-and-field events in the United States. In other countries this group of sporting events is called athletics. Track and field is the oldest form of organized sport. It is a major part of the Summer Olympic Games.

Track Meets and Events

Track-and-field events take place during a competition called a meet, or track meet. Track meets can be held either indoors or outdoors. Most meets take place in outdoor stadiums. These stadiums have a grass infield surrounded by an oval running track.

The contests in a meet are divided into track events and field events. In the track events athletes race against each other. The track used for outdoor running events measures 400 meters around. (One meter is equal to 3.3 feet.) The track is divided into running lanes. All the other events in a meet—the jumps and the throws—are field events. Field events are normally held in the grass infield.

Running Events

Short-distance races are called sprints. They cover distances of 100 meters, 200

Athletes compete in a variety of throwing, jumping, and running events at a track meet.

meters, and 400 meters. Sprinters need to get a quick start. Then they run at top speed for the whole race.

Middle-distance races cover 800 to 2,000 meters. Like sprinters, middle-

distance runners need speed. But unlike sprinters, they do not always run at top speed. They need to adjust their speed to make sure that they have enough strength to run a longer distance. This strategy is called pacing.

Long-distance races cover 3,000 meters or more. Speed is not as important in long-distance races as it is in shorter races. Above all, long-distance runners need good physical conditioning. They have to be able to run for a long time. The marathon is a long-distance race that covers 26 miles 385 yards (42.2 kilometers). Marathons are run on roads. Cross-country races are long-distance events run on natural land.

There are several other types of running events. Relay races involve four runners per team. Each team member runs one fourth of the race's total distance. Hurdling combines sprinting with jumping over barriers called hurdles. The steeplechase is a long-distance race in which runners jump over hurdles and water barriers.

Jumping Events

There are four jumping events at a track meet: the high jump, the pole vault, the long jump, and the triple jump. The high jump and the pole vault are called vertical jumps. The athlete who jumps

In the type of race called hurdling, runners jump over a series of barriers called hurdles.

Pole vaulters use a long, flexible pole to launch themselves over a high bar.

the highest is the winner. High jumpers try to leap over a thin bar balanced between two supports. Pole vaulters also try to jump over a bar, but the bar is set higher. They use a long, flexible pole to gain height. The pole bends to launch the vaulter over the bar.

The long jump and the triple jump are called horizontal jumps. The athlete who jumps the farthest wins these events. In both events the athlete begins with a high-speed run. At the end of the run a long jumper takes a single leap forward. A triple jumper must perform a series of three actions: a hop, a step, and a jump.

Throwing Events

A track meet includes four throwing events: the shot put, the hammer throw, the discus throw, and the javelin throw. In each event athletes try to throw an

object as far as possible. The shot is a heavy metal ball. The hammer is a metal ball connected by a strong wire to a handle. The discus is a plate-shaped disk. The javelin is a spear. The athlete who throws the object the farthest wins.

Decathlon and Heptathlon

The decathlon and the heptathlon are competitions that combine several events. They test all-around athletes. In the Olympics men compete in the decathlon and women compete in the heptathlon. Points are awarded in each event and added up to determine the winner.

The decathlon and the heptathlon each take two days to complete. The decathlon consists of 10 events: the 100-, 400-, and 1,500-meter runs, the 110-meter hurdles, the discus and javelin throws, the shot put, the pole vault, the long jump, and the high jump. The heptathlon consists of seven events: the 200- and 800-meter runs, the 100-meter hurdles, the high jump, the long jump, the shot put, and the javelin throw.

History

People in different cultures have held footraces and other track-and-field contests for thousands of years. The first records of the Olympic Games, held in Greece, date from 776 BC. At those Olympics there was only one event, a footrace. Later Olympics in Greece included a five-event competition. It consisted of a footrace, the long jump, wrestling, and javelin and discus throws. The ancient Olympics ended in the AD 300s.

Track and field as practiced today developed in England. There the sport dates back to the 1100s. But track and field was not well organized as a sport until the 1800s. The sport started becoming popular in the United States in the 1860s.

The Olympic Games began again in 1896. The Olympics helped to spread interest in track and field throughout the world. An organization called the International Association of Athletics Federations (IAAF) now governs track-and-field competition in the Olympics. It also approves all world records in track-and-field events.

Trade

Trade is the buying and selling of goods and services. Goods are objects that people grow or make—for example, food, clothes, and computers. Services

Machines move large containers of goods off a ship and onto trucks at a port in Canada. Shipping goods between countries is an important part of international trade.

are things that people do—for example, banking, communications, and health care. People have traded since prehistoric times. Today most countries take part in international trade, or trade across country borders.

Reasons for Trade

Many children enjoy trading baseball cards. A trade only happens when each person has a card or cards that the other person wants.

Trade happens because people need or want goods that they do not have. People also trade for services when they do not have the time or the skills to do things. Trade between countries happens for similar reasons. For example, some countries have resources, such as oil, or skills, such as car manufacturing, that other countries will buy.

Both people and countries want trade to benefit them. Families want to earn more money than they spend on goods

and services. Countries try to sell, or export, as much as they buy, or import, from other countries.

Trade Limits

In some economies, the government controls all trade. In others, the government allows companies to trade more freely. However, even governments that support free trade control trade in some way. They may keep companies from trading dangerous or illegal products. They may also pass laws to prevent companies from forming monopolies. A monopoly occurs when one company has so much control over a certain type of good or service that no other companies can compete, or make money selling that good or service.

Countries also limit trade between other countries and themselves to protect their economies. Countries may charge tariffs, or special taxes, on foreign goods. They may also set quotas, or limits on the amount of foreign goods they buy.

Free Trade

In the 1900s many countries worked to stop trade limits. Some formed trading blocs, or groups of countries that trade freely. Examples include the North American Free Trade Agreement (NAFTA), the European Union, and South America's Mercosur. In addition, about 150 countries joined the World Trade Organization (WTO). The WTO encourages free trade around the world.

The lifting of trade limits caused international trade to grow. However, some people questioned the idea of free trade.

If governments did not oversee trade, they warned, international companies could pay workers poorly and pollute the environment.

History

Trade developed along with civilization. Before 2000 BC people in the earliest civilizations of Mesopotamia, ancient Egypt, and the Indus Valley traded among themselves and with other peoples. As time passed, civilizations built trade routes. They used these paths to transport spices, salt, gold, and other goods over greater distances. Trade routes went over land and sea.

In the AD 1400s Europeans began exploring by sea to find new trade routes to Asia. Some explored the coast of Africa. Others crossed the Atlantic Ocean to North and South America. By the 1600s Portugal, Spain, England, France, and the Netherlands had set up colonies, or settlements, around the world.

In the 1700s the Industrial Revolution began. This was a period when people invented machines to make goods in factories. This improved manufacturing and transportation, and trade increased. An idea called *laissez-faire* capitalism soon became popular. “*Laissez-faire*” is a French phrase that means “to let do.” It meant that governments should not interfere with trade or other economic activities. It allowed companies and their owners to do whatever they wanted. Many became rich as a result.

Workers soon started labor movements to protest their poor treatment by rich companies. In the early 1900s World War I and the Great Depression led to a decline in trade. Many governments began to support workers and to control trade more strictly. The idea of free trade did not become popular again until after World War II (1939–45).

Trail of Tears

In 1838 and 1839 the U.S. government took away the homeland of the Cherokee people. It forced the Cherokee to travel from the Southeast to what is now Oklahoma. Most of them had to walk all the way. This event is known as the Trail of Tears.

In the early 1800s the Cherokee got along better with the United States than most other Native American groups. Then, in 1835, gold was found on

A painting shows Cherokee taking a long forced journey called the Trail of Tears. Thousands of them died along the way.

Cherokee land in Georgia. Some white people decided to take over the land and push the Cherokee out.

In 1835 a few Cherokee signed a treaty, or agreement, with the U.S. government. They agreed to sell all Cherokee land to the United States for 5 million dollars. But most of the tribe did not think the treaty was legal. The U.S. Supreme Court agreed with them.

President Andrew Jackson and Georgia officials ignored the Court's decision. In

the fall of 1838 U.S. troops began rounding up about 15,000 Cherokee and putting them in prison camps. Local residents burned their homes. Troops then sent the Cherokee west in groups of about 1,000.

The Cherokee suffered terribly on the march, which lasted 116 days. They had to walk in the cold, and they were not allowed to rest. They did not have enough food. Some went by boat in conditions that were just as bad. About 4,000 Cherokee died.

In Oklahoma the Cherokee were given some land. Many Cherokee still live there.

Transplant

During the type of surgery called a transplant, doctors remove a part from a person's body and then replace it with a similar part. A transplant is also called a graft. The purpose of a transplant is to replace a damaged or sick body part with a part that works.

The working part can be from the person's own body or from another person. The person who gets the body part is called the recipient. If another person gives a body part, that person is called the donor. Transplant donors can be living or dead.

When a doctor moves a body part from one place to another on the same person, the operation is called an autograft. One common type of autograft is a skin graft. This operation uses skin from one area of a person's body to replace lost skin on another area.

When a doctor transplants a body part from another person into a recipient, the operation is called an allograft. Allografts can be done with many body parts, including kidneys, livers, lungs, and intestines. These parts can come from living donors. Corneas (parts of eyes needed for sight) and hearts must

Doctors can replace a damaged hip joint with an artificial joint made out of metal and plastic.

come from dead donors. Doctors also can replace certain diseased parts, including heart valves and hip sockets, with artificial, or man-made, ones.

The main problem with transplants is rejection. When this happens the body's immune system treats the new part like a germ or an infection and tries to kill it. To prevent rejection doctors give recipients medicines that keep the body from attacking the new part.

Immune System • Surgery

Transportation

Transportation is a general word for all the methods people use to move themselves and their goods from one place to another. Just as they have for thousands of years, people today rely on walking to travel short distances. For longer distances, people depend on animals, bicycles, automobiles, trucks, railroads, ships, and airplanes.

Some people transport themselves through a city on foot. Others use trains or cars.

Reasons for Transportation

The world's economy depends on transportation. Raw materials must be moved from where they are produced to factories, where they are processed. Food, minerals, and wood often travel by truck, railroad, or ship. Oil and gas often travel by pipeline. Next, manufactured products must be moved from factories to stores. They may travel by truck, railroad, ship, or airplane.

People need transportation to get from home to work, too. Many people drive cars to work. Others take public transportation, including buses and trains. People also take cars, trains, ships, and airplanes to get to vacation spots and to visit family and friends. Some people drive just for enjoyment.

History

Early Transportation

Walking was the main method of transportation until humans domesticated, or tamed, animals. Camels, horses, and cattle then carried goods and people. More than 5,000 years ago people invented the wheel. This allowed animals to pull carts. Ancient peoples also traveled by water, at first with simple dugout canoes and rafts.

The Persians built a system of roads in the 500s BC. The ancient Egyptians, Indians, and Chinese also built roads. By the AD 200s the Romans had built roads across Europe.

Transportation by water expanded in the Middle Ages (AD 500–1500). New ships were built with multiple sails. They were able to travel farther and faster than earlier ships that were powered by rowing. Improvements in navigation made it possible to sail farther from land. Voyages of discovery in the 1400s and 1500s opened up trade routes between distant points.

Modern Transportation

The invention of the steam engine in the 1700s was an important event in transportation history. Steam-powered boats could easily travel upriver. Steam-powered ships could cross oceans without wind. On land, inventors used steam engines to power locomotives. This led to the growth of railroads. By 1869 a railroad ran across the United States, and steamships regularly crossed

An ocean liner unloads war prisoners during World War II (1939–45). Liners were an important means of transportation during the first half of the 1900s. In peacetime they carried rich people to vacation spots and poor immigrants to new homes.

the Atlantic Ocean. Trips that had taken weeks now took days.

Builders of canals made some ocean trips much shorter. The Suez Canal in Egypt shortened the trip between Europe and Asia by thousands of miles. The Panama Canal in Panama shortened the trip between the East and West coasts of North America.

The late 1800s saw the first successful bicycles and automobiles. They made quick and easy transportation available to more people than ever before. People who bought cars demanded more and better roads.

In 1903 the U.S. inventors Wilbur and Orville Wright flew the world's first airplane. The invention of the jet engine in the 1940s made air travel the fastest transportation in history.

Transportation Problems

Advances in transportation have led to problems, however. Cars and trucks cause traffic jams, accidents, and air pollution. These vehicles also use oil for fuel. The supply of oil is limited and controlled by a few countries. To ease crowded roads, governments have worked to improve public transportation. To fight pollution, scientists are developing vehicles that run on different types of fuel.

Tree

Trees are tall, woody plants. They usually have a stem called a trunk. Trees are the largest and oldest living things on Earth. Some trees live for hundreds or even thousands of years. There are more than 80,000 species, or types, of tree. Well-known trees include birches, firs, maples, palms, and pines.

Groups of Trees

Scientists divide trees into groups based on how they reproduce. Some trees reproduce with spores, or particles that grow into new plants. They are called tree ferns. Most trees reproduce with seeds.

People grow eucalyptus trees for their wood and oil. The leaves of some kinds of eucalyptus contain an oil used in medicines.

Some seed-bearing trees grow their seeds in cones. They are called conifers. Most conifers have needle-shaped leaves. Other seed-bearing trees grow their seeds in fruits or pods. They are known as

broad-leaved or flowering trees. They have broad, flat leaves.

Scientists also group trees based on whether they lose their leaves. Trees that keep their leaves year-round are called evergreens. Trees that lose their leaves at some point during the year are called deciduous trees.

Physical Features

Trees are usually more than 10 feet (3 meters) tall. They have roots, a trunk, branches, and leaves. The trunk and branches are made of fibers called wood. These fibers are protected by an outer covering called bark. As the tree ages, the trunk and branches thicken.

The Lawson cypress and the English elm look different because they are two different types of tree. The Lawson cypress is a conifer and an evergreen. It produces seeds in cones and has needlelike leaves that stay on all year. The English elm is broad-leaved and deciduous. It produces seeds in fruits and has leaves that fall off in autumn.

The leaves make food for the tree through a process called photosynthesis. Veins run through the leaves. They carry water and food to and from the branches. Leaves are usually green. The leaves of deciduous trees often change colors in autumn before they fall off. New leaves then grow in spring.

Uses

Trees are very important to people. Tree wood is used to build homes and furniture. Paper is made from wood fibers. Many people burn wood to cook and to heat their homes. Farmers plant trees that grow fruit for people to eat.

Trees also help keep the air clean. They release oxygen for animals, including humans, to breathe. They take in the carbon dioxide that animals breathe out.

Triceratops

The dinosaur known as *Triceratops* looked something like a modern rhinoceros. However, it had three sharp horns on its head. The name *Triceratops* means “three-horned face.” *Triceratops* also had a bony neck frill that surrounded the head like a huge collar.

When and Where *Triceratops* Lived

Triceratops lived about 70 to 65 million years ago. It was among the last dinosaurs to live on Earth before the dinosaurs disappeared. Fossils, or remains, of

Triceratops have been found in North America.

Physical Features

Triceratops was the largest of the horned dinosaurs. It weighed up to 5 tons and reached a length of nearly 30 feet (9 meters). The skull and neck frill of *Triceratops* often measured more than 6 feet (2 meters) long. Each of the two horns above the eyes was longer than 3 feet (1 meter). The horn on the snout was short and thick. The massive body of *Triceratops* was supported by four sturdy legs. Its back legs were longer than its front legs. It had feet like an elephant. *Triceratops* had a fairly short, thick tail.

Behavior

Triceratops was a slow-moving plant eater. The neck frill acted as a protective shield against such enemies as *Tyrannosaurus rex*. *Triceratops* also used its long horns to defend itself and to fight rival males. *Triceratops* lived and traveled together in groups. Adults may have protected their young by forming an outward-facing circle around them.

Trinidad and Tobago

Children dress in colorful costumes for a carnival celebration in Trinidad and Tobago.

The Republic of Trinidad and Tobago is an island country in the Caribbean Sea. The capital is Port of Spain.

The island of Trinidad is larger than the island of Tobago. Trinidad is only about 7 miles (11 kilometers) from the coast of Venezuela in South America. Both islands are mountainous. Trinidad has many short rivers, but Tobago has only a few streams. The country has a warm climate with dry and rainy seasons.

Tropical rain forests grow in the high areas. The islands' animals include golden tree frogs, porcupines, armadillos, wild pigs, and rodents. The scarlet ibis is the country's national bird.

Blacks and East Indians each make up about 40 percent of the population. Most of the rest of the people have mixed roots. English is the main language. More than half of the people are Christians. Many of the East Indians follow Hinduism or Islam.

Trinidad and Tobago has a strong economy. The country produces petroleum (oil) and natural gas. Manufacturing and tourism are also important to the islands. The country's products include sugar, chemicals, fertilizers, steel, and cement. Farmers grow sugarcane, oranges, rice, coffee, and cocoa.

Arawak Indians lived on Trinidad when Christopher Columbus arrived in 1498. As the Spanish took control, almost all the Indians died. French settlers came in the 1700s. They brought Africans with them as slaves. Great Britain took over Trinidad in 1797 and Tobago in 1814. The British brought people from India to work on plantations.

Trinidad and Tobago gained independence in 1962. The country discovered its huge oil and gas deposits in 1998.

Tropical Rain Forest

► see Rain Forest.

Tropics

The region of Earth's surface that is closest to the equator is called the tropics. Two imaginary lines that circle the globe mark the boundaries of the tropics. The line called the Tropic of Cancer marks the northern edge. Its latitude (distance from the equator) is $23^{\circ} 27' \text{ N}$. The line called the Tropic of Capricorn marks the southern edge. Its latitude is $23^{\circ} 27' \text{ S}$.

The tropics are the only part of Earth where the sun sometimes shines straight down. Because the sunlight is so strong, the tropics are generally warmer than other parts of Earth. Tropical temperatures are warm or hot throughout the year. The temperatures do not change

greatly, but winds and rain bring different types of weather. Most tropical places experience wet and dry seasons.

Areas closest to the equator are the wettest. A great deal of rain falls year-round. Dense rain forests cover the land. The largest tropical rain forests on Earth lie in Brazil and in parts of Africa.

The climate is drier in tropical regions that lie farther north and south of the equator. In these regions there are one or two dry seasons each year. The forests may be deciduous, meaning that the trees shed their leaves during the dry periods. Savannas, or grasslands with scattered trees, are also common.

The driest parts of the tropics lie near the northern and southern edges. Here the dry season is long. Few trees grow. Shrubs and low grasses cover the land. Two of Earth's big deserts, the Sahara and the Kalahari, lie on the edges of the tropics.

Many plants and other products that people value come from the tropics. Some of these are bananas, coffee, cocoa, tea, rubber, spices, nuts, and tropical wood.

Trout

Trout are a kind of fish that many people like to catch and eat. Trout are closely related to salmon. Most species, or types, of trout are freshwater fish. Many live in clear, cool streams and lakes. Some types live in the ocean but return to freshwater to breed.

There are two main groups of trout species: black-spotted trout and speckled trout. The species of black-spotted trout include rainbow, cutthroat, and golden trout. Black-spotted trout range in color from silver, brown, or dark gray to shiny green, blue, red, or gold. They all have small black spots on the back.

The species of speckled trout include brook, Dolly Varden, lake, and bull trout. Some speckled species are also called chars. Speckled trout have lighter spots on a darker body. Many speckled species have pinkish or red spots, especially on the underside.

The brown trout is separate from the black-spotted trout and speckled trout. It has a brown body with black spots.

The rainbow trout is popular with people who fish for sport.

Trout vary in size, depending on the species. Many species of trout are about 1 foot (30 centimeters) long.

Trout eat insects, small fish, and eggs of other fish. Many species spawn, or reproduce, in the spring or the fall. The females bury their eggs in gravel nests that they dig in the bottom of streams. The eggs hatch after two or three months.

Truman, Harry S.

After President Franklin D. Roosevelt died in 1945, Vice President Harry S. Truman became the 33rd president of

Harry S. Truman was the 33rd president of the United States.

the United States. Truman led the country through the end of World War II. After the war he worked to stop the spread of Communism.

Early Life and Career

Truman was born in Lamar, Missouri, on May 8, 1884. He was the oldest of the three children of John Anderson Truman, a farmer, and Martha Young. Harry graduated from high school in Independence, Missouri.

A member of the Missouri National Guard, Truman volunteered to serve in World War I in 1917. He fought in France and then returned to the United States in 1919. That year he married Elizabeth (Bess) Wallace. They had one daughter.

With an Army friend, Truman opened a men's clothing store in Kansas City. The business failed in the early 1920s.

Political Career

The Democrats who controlled Kansas City got Truman elected as a county judge in 1922. In 1934 he won a seat in the U.S. Senate.

In 1944 President Roosevelt chose Truman as his vice presidential running mate. After winning the election, Roosevelt died suddenly on April 12, 1945. Truman then became president.

Presidency

World War II in Europe soon ended, but war with Japan continued. Hoping to prevent more U.S. deaths by making

TIMELINE

Truman is born in Lamar, Missouri.		Roosevelt dies; Truman becomes president.		The Korean War begins.		Truman dies in Kansas City, Missouri.
May 8, 1884	1944	April 12, 1945	August 1945	1950	1953	December 26, 1972
	Truman is elected vice president under Franklin D. Roosevelt.		Truman orders atomic bombs dropped on Japan; World War II ends.		Truman retires from office.	

Japan surrender, Truman decided to use the newly invented atomic bomb in Japan. In early August 1945 U.S. airplanes dropped atomic bombs on the cities of Hiroshima and Nagasaki. The bombs killed more than 100,000 men, women, and children. Japan surrendered on August 14, 1945.

After the war Truman helped the United States join the United Nations, a new international peace organization. He also introduced the Truman Doctrine. That policy said that the United States would fight the spread of Communism, the political system of the Soviet Union.

In 1948 Truman approved the Marshall Plan. Under the plan the United States sent billions of dollars to help rebuild Europe. By strengthening the economies of western Europe, the plan prevented Communism from spreading there. That year Truman also ordered desegre-

gation (the mixing of races) in the U.S. military.

After beginning his second term in 1949, Truman presented a program of reforms called the Fair Deal. He wanted more public housing, more money for education, higher wages, government-protected civil rights, and national health insurance. Congress did not pass most of the Fair Deal reforms, but citizens debated Truman's ideas for years to come.

The Korean War began during Truman's second term. In 1950 Communist North Korea invaded South Korea. Backed by the United Nations, Truman ordered U.S. military forces to help South Korea. The war dragged on past the end of Truman's presidency.

Retirement and Death

After his term ended in 1953, Truman retired to Independence, Missouri. He

died in Kansas City, Missouri, on December 26, 1972.

Truth, Sojourner

Sojourner Truth spoke out against slavery and for women's rights in the 1800s. Her courage and powerful way of speaking helped the causes of both African Americans and women in the United States.

Early Life

Truth was born a slave in the U.S. state of New York in about 1797. She was originally named Isabella Baumfree. Isabella worked for several different owners. Her last owner, Isaac Van Wagener, freed her just before slavery ended

Sojourner Truth

in New York in 1827. Isabella took the last name Van Wagener.

Speaking Out

In 1829 Isabella moved to New York City and worked as a house cleaner. In 1843 she left New York to become a traveling preacher. She also changed her name to Sojourner Truth.

Truth discovered that some people had started working to end slavery. This movement was called abolitionism. She began speaking out against slavery in the late 1840s. She soon became a popular abolitionist speaker throughout the North and the Midwest. In 1850 Truth published her life story, called *The Narrative of Sojourner Truth*.

Truth also defended women's rights. She complained that women could not vote or serve on juries. She also pointed out that they received less money than men for the same work.

Later Years

After the American Civil War started in 1861, Truth became even more famous. In 1864 she visited Washington, D.C., where she met President Abraham Lincoln. Also in 1864 Truth took a job with the National Freedmen's Relief Association, a group that helped former slaves.

In 1875 Truth retired to her home in Battle Creek, Michigan. She died there on November 26, 1883.

Tsar

Ivan IV, known as Ivan the Terrible, was the first Russian ruler to use the title of tsar.

When Russia had a royal family, the emperor was called the tsar. A Russian empress's title was tsarina, a prince's title was tsarevich, and a princess's title was tsarevna. Tsars ruled Russia from 1547 to 1917.

The term tsar (also spelled czar) is the Russian version of Caesar, the family name of Julius Caesar and the first emperors of Rome. The link between Rome and Russia was the Byzantine Empire, which began as the eastern branch of the Roman Empire and fell in 1453. In 1472 Ivan III, the prince of Moscow, married the niece of the last Byzantine emperor. Ivan III's grandson, Ivan IV, was the first Russian ruler to

use the title of tsar. Known as Ivan the Terrible, he had great power and ruled harshly. Later tsars had similar qualities.

In 1721 Peter the Great stopped using the title of tsar. Even so, Russia's emperors continued to be called tsars until the last of them, Nicholas II, was removed from the throne. Revolutionaries killed Nicholas and his entire family in 1918 so that no descendants could claim the title in the future.

Tsunami

Natural disasters, both on land and under the ocean, may cause deadly ocean waves called tsunamis. By the time a tsunami reaches shore, it has gained tremendous size and power. Tsunamis can wipe out entire coastal villages or towns.

Earthquakes, landslides, or volcanic eruptions can trigger waves in a nearby ocean. These waves may travel for thousands of miles. They may move as fast as 500 miles (800 kilometers) an hour. As they approach a coastline, the waves move more slowly. They also rise, often to heights as great as 100 feet (30 meters). As the first huge wave nears

Did You Know?

Tsunami is a Japanese word. Tsunamis used to be called tidal waves, but they have nothing to do with tides.

A diagram shows the different elements of a tsunami. An undersea earthquake causes waves to spread out in the ocean. As the waves approach a coast, they hit land under the water. This makes the waves much larger.

land, the coastal water often draws back dramatically. Then the tsunami hits the land.

Tsunamis cannot be stopped, but there are ways to defend against them. Scientists around the world watch for early signs of earthquakes. They also note unusual changes in ocean levels. With this information, scientists can warn people to leave areas that a tsunami might hit.

The Pacific Ocean is the site of many tsunamis, but tsunamis can form in the Atlantic and Indian oceans, too. A powerful earthquake struck beneath the Indian Ocean in December 2004. The earthquake set off tsunamis that hit about 10 countries. More than 200,000 people died.

Tuberculosis

Tuberculosis, or TB, is a disease that usually affects the lungs. Tuberculosis used to be a leading cause of death in Europe and North America. Today tuberculosis is treatable.

Certain types of tiny living things called bacteria cause tuberculosis. One type of bacteria causes most cases of tuberculosis in humans. It infects the lungs. This may lead to coughing, chest pain, difficulty breathing, loss of energy, and weight loss. The person may even cough up blood. Infected people spread the disease to others when they cough or sneeze.

Another type of bacteria causes a less common form of tuberculosis. This form of tuberculosis may damage the bones and joints. Humans get it by

A doctor looks at the chest X-rays of patients infected with tuberculosis.

drinking milk from a cow infected with the bacteria. This form of tuberculosis can be prevented by pasteurizing milk, or heating it to kill the bacteria.

Tuberculosis spreads most easily in crowded places where living conditions are poor. In some countries people get something called a vaccine to protect them from tuberculosis. If people do get tuberculosis, doctors treat them with a medicine called an antibiotic. People given antibiotics have a good chance of recovering from the disease.

Tubman, Harriet

Harriet Tubman

In the middle of the 1800s Harriet Tubman escaped from slavery in the southern United States. She then helped lead many other runaway slaves to freedom. She also served the Union during the American Civil War.

Harriet Tubman was born in about 1820 in Dorchester County, Maryland. She was one of 11 children of a slave family. Her name at first was Araminta Ross. She later changed her first name to Harriet, which was her mother's name.

In about 1844 Harriet married a free African American named John Tubman. In 1849, after hearing that she was to be sold, she escaped to Philadelphia, Pennsylvania, without her husband.

In Pennsylvania Tubman became a “conductor” for the Underground Railroad. The railroad was a secret network that helped escaped slaves to find their way to freedom. By 1857 she had freed hundreds of slaves, including her own parents. She said that she “never lost a passenger,” even though slaveholders offered large rewards for her capture.

During the American Civil War, Tubman went to South Carolina with the Union Army. She served as a nurse and a scout. She even led raids against the Confederates.

After the Civil War Tubman settled in Auburn, New York, with her parents. There she worked for racial justice and also for women's rights. She believed that the two struggles were closely linked. In 1908 she opened a home for aged and poor African Americans. Harriet Tubman died in Auburn on March 10, 1913.

Did You Know?

Tubman was called “the Moses of her people” because she led black people to freedom. (Moses led the Jewish people to freedom in ancient times.)

Tulip

Tulips are plants that bloom in early spring. The flowers are cup-shaped and very colorful. They are among the most popular garden flowers. There are about 4,000 varieties of tulip. They belong to the lily family.

Tulips first grew in south-central Asia. People brought the flowers to Europe in the 1500s and later to many different parts of the world. The Netherlands became the center of tulip production in the 1600s. It still is today.

Tulips normally grow from bulbs that are planted in autumn. Each bulb produces a plant each spring for a few years. A tulip plant has two or three thick, bluish green leaves. These are attached at the bottom of the stem. In most types of tulip each stem grows a single flower.

Tulip flowers occur in almost every color—white, yellow, pink, red, orange,

Tulips surround the trunks of birch trees.

purple, and even brown and black. The color is either solid or streaked. Streaked tulips get their streaks because of a harmless virus. The virus makes the top color disappear in some places. The flower's underlying white or yellow color then shows through.

Tuna

Tuna are large fish that live in most parts of the world's oceans. They belong to the same family of fish as mackerel. Tuna is one of the most popular foods that comes from the sea. Most of the tuna that fishers catch is canned.

There are seven different species, or types, of tuna: bluefin, albacore, yellowfin, bigeye, blackfin, longtail, and southern bluefin. The skipjack tuna is related to these species, but it belongs to a separate group of fish.

A tuna has a long, rounded body. It is usually dark on top and silvery underneath. Some species have spots or stripes.

Many species of tuna are about 35 inches (90 centimeters) long. The bluefin tuna is the largest species. It can grow as long as 14 feet (4 meters) and weigh up to 1,800 pounds (800 kilograms).

Tuna travel in large groups called schools. Some species travel long distances. Tuna feed on other fish, including herring, menhaden, and mackerel.

The bluefin tuna is the largest type of tuna.

Some species also eat small, spineless animals such as squid. Some types of tuna return to the waters where they hatched to spawn, or produce eggs.

Tundra

Tundras are large, barren regions with no trees. In fact, the word tundra comes from the Finnish word *tunturia*, which means “treeless plain.” Tundras lie between the permanent ice of the far north and the northern forests of North America, Europe, and Asia. They cover about 20 percent of Earth’s surface.

Features

Tundras may be flat, hilly, or mountainous. Little plant life grows on the bare or rocky ground. Tundras in coastal areas tend to be foggy. Snow covers the world’s tundras for more than six months of the year.

Types of Tundras

Arctic tundras lie in northern Europe, Russia, Alaska, Canada, and Greenland.

In these tundras the winter temperature may be as low as -25°F (-32°C). The summer temperature may rise only to 40°F (4°C). Because of these cold temperatures, Arctic tundras have a permanent layer of frozen soil, called permafrost. Some permafrost reaches as deep as 1,500 feet (456 meters).

Alpine tundras lie farther south than Arctic tundras. Alpine tundras are found in high mountains above the tree line. (The tree line is the highest place where trees can grow.) They have short, cool summers and less extreme winters than Arctic tundras. Alpine tundras do not have a layer of permafrost.

Life in a Tundra

Only low-growing plants, such as mosses and shrubs, can survive in tundras. Plantlike living things called lichens also grow there.

Tundra animals must be able to survive long, cold winters. Many birds live there in the summer, but few stay through the winter. Some common tundra animals

Reindeer graze on the Arctic tundra of Canada’s Northwest Territories.

are reindeer, Arctic foxes, snowy owls, musk oxen, and polar bears.

Very few people live in tundras. Arctic peoples, including the Eskimo (Inuit), tend to live in places where hunting and fishing can provide enough food year-round.

Resources

The ground of many tundras contains coal, oil, iron ore, lead, or other resources. Many companies have set up mining operations in tundra regions. However, some people worry that mining and oil drilling endangers tundra plants and animals.

Tunis

Population
(2007 estimate)
745,000

Tunis is the capital of Tunisia, a country in northern Africa. It is the largest city in Tunisia by far. Tunis lies near the coast of the Mediterranean Sea. A canal links it to a port on the sea.

Tunis is Tunisia's center of industry. Factories in the city make food products, cloth, clothing, and electronics. Many

The Grand Mosque of Tunis, Tunisia, is decorated with colorful tiles.

people in Tunis work in banking, tourism, or other service industries.

People called the Libyans founded Tunis in ancient times. Later, people called the Phoenicians built the city of Carthage nearby. Carthage became a great power. Tunis came under its rule. The Romans destroyed Tunis during a war with Carthage in 146 BC. They later rebuilt Tunis as a city of the Roman Empire.

Arabs captured Tunis in the AD 600s. The city later became the capital of a Muslim empire. In the 1200s Tunis was one of the leading cities in the Muslim world.

Tunis and the rest of Tunisia became part of the Turkish Ottoman Empire in 1574. France took control of Tunisia in 1881. In 1956 Tunisia became an independent country with Tunis as its capital.

Carthage • Tunisia

Tunisia

Tunisia is the smallest country in North Africa. In ancient times Tunisia was the site of the great city of Carthage. Today Tunisia's capital is Tunis.

Geography

Tunisia shares borders with Algeria and Libya. The Mediterranean Sea lies to the east and the north. Tunisia is only about 100 miles (160 kilometers) from Sicily, an island of Italy.

Mountain chains run through northern Tunisia. The country's largest river, the Majardah, flows through the north. The central part of Tunisia is a large plateau, or area of flat, raised land. There are shallow salt lakes farther south. The southern tip of Tunisia is a part of the Sahara Desert. The land there is sandy and rocky.

Northern Tunisia has mild, rainy winters and hot, dry summers. The south is warmer and drier.

Plants and Animals

Most of Tunisia's plants and animals are in the cooler northern region. The north has vineyards and forests of cork oak and evergreen oak. Thorny bushes and grasses grow farther south. The Sahara region in the far south has few plants.

Tunisia's animals include hyenas, wild boars, jackals, gazelles, and cobras. Scorpions live throughout the country.

People

Most of Tunisia's people have a mixture of Arab and Berber roots. (The Berbers were the first people in the region.)

Most Tunisians call themselves Arabs.

The main language is Arabic, but many people also speak French. Almost all the people are Muslims. More than half of all Tunisians live in cities and towns.

Most people live near the Mediterranean coast.

Economy

Tourism and other services are key parts of Tunisia's economy. Manufacturing and mining are also important. The country's factories make processed foods, steel, chemicals, clothing, and leather goods. Tunisia also produces oil. Mines provide phosphates and iron. Tunisia uses the phosphates to make chemicals and fertilizers.

Tunisia is home to many ancient buildings, including Islamic buildings called *ribats*. *Ribats* served as both monasteries and fortresses.

Facts About TUNISIA

Many Tunisians work in agriculture. Wheat and barley are the main food crops. Farmers also grow olives, tomatoes, sugar beets, citrus fruits, and dates. Sheep, goats, and cattle are the main livestock.

History

In ancient times Tunisia was a colony of the Phoenicians, a people from what is now Lebanon. In the 800s BC the Phoenicians founded the city of Carthage near what is now Tunis. By the 400s BC the city controlled trade in the western Mediterranean Sea. In the 200s and 100s BC Carthage fought Rome in a series of wars. The Romans destroyed Carthage in 146 BC and took over the land.

Muslim Arabs invaded the region in the AD 600s. Spain and the Ottoman Turks

battled for control of the area in the 1500s. In 1574 the Turks defeated the Spanish and made Tunisia a part of the Ottoman Empire. As the Ottomans weakened in the late 1800s, France, Great Britain, and Italy tried to control the region. Tunisia became a territory of France in 1881. France allowed Tunisia's bey, or king, to stay on the throne, but the French held the real power.

Tunisia gained independence from France in 1956. The next year Tunisia ended its monarchy. The country's first president stayed in power until 1987. Tunisia's second president held power into the 21st century.

Carthage • Tunis

Turkey

Parts of Turkey are very mountainous.

The Republic of Turkey lies partly in Asia and partly in Europe. For centuries Turkey was the heart of two great empires—the Christian Byzantine Empire and the Islamic Ottoman Empire. Modern Turkey's capital is Ankara.

Geography

Most of Turkey is on a peninsula in southwestern Asia. A peninsula is a piece of land surrounded by water on three sides. The peninsula is known as Anatolia or Asia Minor. A small part of Turkey is in southeastern Europe. Narrow waterways and the Sea of Marmara separate the two parts of Turkey.

The Black Sea lies north of Turkey. Georgia, Armenia, and Iran are to the east. Iraq, Syria, and the Mediterranean Sea lie to the south. The Aegean Sea, Greece, and Bulgaria lie to the west.

The Asian part of Turkey has mountains and a central plateau, or

raised flat area. The highest peak is Mount Ararat, which rises 16,853 feet (5,137 meters). The European part of Turkey is lower and flatter. The country's longest river, the Kizil, flows through the peninsula.

Most of Turkey has a dry climate with hot summers. Winters are cold in central Turkey and mild near the coasts. Earthquakes are common.

Plants and Animals

Grasslands cover much of the country. Pine, oak, cedar, juniper, and chestnut trees grow along the coast.

Deer, wild goats, bears, and lynx live near the Mediterranean coast. Gazelles and hyenas live in central and eastern Turkey. Wolves, jackals, badgers, and otters live throughout the country. Turkey's birds include buzzards, storks, vultures, and eagles.

People

Most of Turkey's people are Turks. They speak a language called Turkish. Most of the rest of the people are Kurds. They live in eastern Turkey and have their own language. Almost all the people of Turkey follow Islam.

More than half of the population lives in cities and towns. Turkey's largest city is Istanbul.

Economy

Services and manufacturing are the main parts of Turkey's economy. Services include communications, transportation, and tourism. Manufacturers produce fabrics, clothing, processed foods, iron and steel, chemicals, cars, and electronics. Turkey's land provides oil, coal, copper, and other minerals.

The Hagia Sophia in Istanbul, Turkey, has been a Christian church and a Muslim mosque. Now it is a museum.

Many Turks are farmers. Wheat, sugar beets, citrus fruits, cotton, olives, tobacco, and figs are important crops. Sheep, cattle, and goats are the main livestock.

History

Humans have lived in the Asian part of Turkey, called Anatolia, since at least 7000 BC. The Hittite people invaded in about 2000 BC. Greeks and Persians later fought over the land. Romans took over Anatolia by about 30 BC.

Byzantine Empire

Under the Roman Empire, Anatolia was at peace. In AD 395 the Roman Empire was divided into western and eastern parts. The eastern part became known as the Byzantine Empire. Its capital was the city of Constantinople (now called Istanbul). Christianity was the main religion of the Byzantine Empire.

The Seljuk Turks invaded Anatolia beginning in the 1040s. The Seljuk Turks were Muslims from central Asia. In 1071 they defeated the Byzantine army. During the next 200 years the Christians of Europe fought the Turks in a series of wars known as the Crusades.

Ottoman Empire

In the late 1200s a new group of Turks gained power in Anatolia. They founded the great Ottoman Empire. In 1453 the Ottoman Turks captured Constantinople. They renamed the city Istanbul and made it their capital.

TIMELINE

Hittites invade Anatolia.		Anatolia becomes part of the Byzantine Empire.		The Ottoman Turks gain power.		Kurds begin fighting the Turkish government.
about 2000 BC	about 30 BC	AD 395	1071	1300	1923	1983
	Romans take control of Anatolia.		The Seljuk Turks defeat the Byzantines.		The Republic of Turkey is formed.	

By the mid-1500s the Ottoman Empire stretched across North Africa, the Middle East, and southeastern Europe. The empire then grew weaker. It collapsed at the end of World War I in 1918.

Turkey Under Atatürk

After the war many Turks were angry at the Ottoman government, which had lost much of the empire's land. A military leader named Mustafa Kemal formed a separate government. In 1923 he founded the new country of Turkey. The city of Ankara became the new capital. Kemal became Turkey's first president.

Kemal ruled with strong powers. He soon took the name Atatürk, which is Turkish for "father of the Turks."

Atatürk wanted to make Turkey a more modern country. He closed Islamic schools and courts. He banned traditional clothes such as the fez, a type of

Turkish hat. He also gave women the right to vote. Atatürk died in 1938.

Turkey After Atatürk

In 1960 and 1980 the military took over Turkey's government. In 1997 the military forced the prime minister to step down. Each time Turkey returned to democracy.

Beginning in the 1950s Turkey disagreed with Greece over control of the island of Cyprus. Turkish forces invaded northern Cyprus in 1974. Turkey supported the Turks of Cyprus when they formed a separate country in 1983.

Modern Turkey has also faced a long rebellion by Kurds in the east. The Kurds fought the Turkish government from the 1980s into the 21st century.

Turkey

Two male common turkeys in the wild display their feathers.

Turkeys are large birds. They are found in the wild and they are also raised for food. The two species, or types, of turkey are the common turkey and the ocellated turkey.

The common turkey prefers places with mild temperatures. It usually has black feathers mixed with a shiny green or bronze color. The head and neck are

featherless, bumpy, and bright red. Males have a piece of red skin growing from the forehead. Male turkeys often make a gobbling sound while females make a clicking noise.

Some common turkeys live in the wild. They are found in parts of Mexico and the United States. Wild turkeys prefer forests and swamps. Males weigh about 22 pounds (10 kilograms), but females are much smaller. Wild turkeys can fly, but only for short distances.

Many common turkeys are kept on farms and raised for food. These turkeys are usually heavier, and they cannot fly. Their feathers are usually white.

The ocellated turkey is found in Central America. It is much smaller than the common turkey. It has a blue head and neck with reddish yellow bumps. Its tail feathers are tipped with blue and gold, somewhat like a peacock. The ocellated turkey is not raised for food.

(Left) Many turkeys are raised for their meat; (right) ocellated turkeys live only in the wild.

Turkmenistan

A vendor sells dried fruits and nuts at a market in Turkmenistan.

Turkmenistan is a desert country in central Asia. The capital is Ashgabat.

Turkmenistan is on the southeastern coast of the Caspian Sea. It shares borders with Kazakhstan, Uzbekistan, Afghanistan, and Iran.

The sandy Karakum Desert covers most of the land. Southern Turkmenistan has some mountains and hills. Turkmenistan

© 2006 Encyclopædia Britannica, Inc.

has a very dry climate with hot summers and cold winters.

Grasses and shrubs grow in the dry areas. Fig and nut trees grow near the mountains. Foxes, wildcats, cobras, lizards, and gazelles live in the desert. Leopards and porcupines live in the hills.

Turkmenistan is named after its main group of people, the Turkmen. The country also has some Uzbeks, Russians, and Kazakhs. Most of the Turkmen are Muslims. The people live mainly in southern oases (desert areas with a water supply) and along the rivers in the east.

The economy of Turkmenistan depends on agriculture and the production of natural gas and oil. Farming is possible with the help of irrigation, or artificial watering systems. The main crops are cotton and grain. People also raise sheep and use their wool to make carpets. Factories produce metals, machinery, chemicals, and fabrics.

The Parthian Empire of Iran ruled the region in ancient times. Turkmen nomads, or wanderers, entered the area by AD 1100. Russia conquered the region by 1881. In 1925 Turkmenistan became part of the Soviet Union. Turkmenistan gained independence in 1991.

Turner, Nat

An account of Nat Turner's slave rebellion was published in 1832.

In the United States before the American Civil War, many slaves escaped to freedom. Others rebelled with violence against their owners. A slave named Nat Turner led one of the bloodiest slave revolts in U.S. history. Southern states reacted to Turner's revolt by passing laws that made the lives of slaves even more difficult.

Early Life

Nat Turner was born on October 2, 1800, on a farm in Virginia. He had several owners. In 1831 he joined the household of a man named Travis.

Unlike most slaves, Turner learned to read and write. He also learned about the Christian religion. He came to

believe that God had chosen him to free all slaves.

Revolt

On August 21, 1831, Turner and seven other slaves killed everyone in the Travis family. In the next two days, Turner picked up about 75 followers. They killed about 60 white people.

Then about 3,000 whites rose up to stop the revolt. Whites killed most of Turner's men. Whites captured Turner, put him on trial, and put him to death on November 11, 1831.

Turner's revolt frightened Southern whites. They blamed his rebellious spirit on his education, so they tried to stop slaves from learning to read and write. They also tried to stop slaves from gathering in groups.

Turtle

A turtle is a reptile that has a shell covering its body. Turtles are known for moving very slowly. There are about 250 species, or types, of turtle.

Turtles are found in most parts of the world. Most live in freshwater ponds, lakes, or rivers. Others live in the ocean or on land. Some turtles live in forests or even in the desert. Land turtles are often called tortoises. Some water turtles are known as terrapins.

A desert tortoise creeps among wildflowers in the U.S. state of California.

Turtles are all different sizes. The smallest turtles are less than 4 inches (10 centimeters) long. In contrast, the Atlantic leatherback turtle can be more than 7 feet (2 meters) long. It can weigh more than 1,500 pounds (680 kilograms).

Turtles have sturdy legs with short feet and claws on the toes. Sea turtles have flippers instead of front feet. A turtle's shell is made of bone. It is usually very hard and strong. Most turtles can tuck the head, legs, and tail inside the shell for protection from enemies. Snapping turtles cannot do this, but they have a powerful bite for protection.

Turtles eat worms, snails, insects, jellyfish, and shellfish. Many tortoises eat only plants. Turtles can store food in the form of fat. Some turtles can store water, too. They can live for days or even weeks without having anything to eat or drink.

All turtles lay their eggs on land. The female digs a hole and lays her eggs in it. The temperature in the nest usually affects the sex of the baby turtles.

Warmer temperatures generally produce females, while cooler temperatures produce males.

Turtles live longer than most other animals. Some species can live more than 100 years.

Tuscarora

The Tuscarora are Native Americans of New York State and Ontario, Canada. In the 1700s they became the sixth tribe to join the group called the Iroquois Confederacy.

The Tuscarora lived in round homes made from poles covered with bark. Later they also lived in homes called longhouses, which were large enough for

A Tuscarora dancer performs at the New York State Fair in Geddes, New York.

several families. The Tuscarora grew corn, gourds, beans, and apples. They also hunted and gathered wild plants.

By the early 1700s British colonists had moved into Tuscarora territory. At that time the Tuscarora lived in North Carolina and Virginia. The settlers mistreated the tribe. They kidnapped Tuscarora men, women, and children and sold them as slaves. They also took the tribe's lands without payment.

The Tuscarora fought back in 1711 by attacking several British settlements. The attacks started a war. At least 1,000 Tuscarora were killed in the fighting. The Tuscarora who survived fled north to New York. There, in 1722, they joined the Iroquois Confederacy.

After the American Revolution (1775–83) many Tuscarora moved to new lands near Lewiston, New York. That area later became the Tuscarora Reservation. Some Tuscarora moved to lands along the Grand River in what is now Ontario. That area is now the Six Nations Reserve. At the end of the 20th century nearly 2,500 Tuscarora lived in the United States. More than 1,900 others lived in Canada.

Tuskegee Airmen

The Tuskegee Airmen were the first group of African Americans to fly warplanes for the U.S. military. They served during World War II. At that time, dur-

A poster from World War II shows an African American airman.

ing the 1940s, African Americans had fewer rights than whites had. The Tuskegee Airmen did their jobs as well as any white pilots. After seeing how well the airmen did, other African Americans pushed harder for equal rights.

Before the United States entered World War II, the National Association for the Advancement of Colored People (NAACP) asked the U.S. government to allow African Americans to fly warplanes. The military was then segregated, or separated by race. Because of this, the U.S. Army started a training program for African Americans only.

The airmen got their training in Alabama at the Tuskegee Army Air Field and at an African American college called Tuskegee Institute. The first Tuskegee Airmen graduated in 1942. Eventually 992 pilots graduated from the training program.

Did You Know?

Most of the Tuscarora were on the side of the colonists during the American Revolution.

The Tuskegee Airmen served in Europe and North Africa. They flew small airplanes that protected bigger airplanes that dropped bombs on enemy targets. The airmen never allowed an enemy airplane to shoot down a U.S. bomber.

In 1948, three years after World War II ended, President Harry S. Truman ended racial segregation in the military. After that African Americans served alongside whites.

Tutankhamen

Tutankhamen was a pharaoh, or king, of ancient Egypt in the 1300s BC. He became pharaoh when he was still a child. He is famous today because of the many treasures found inside his tomb, or grave.

Life

Tutankhamen married while very young. His wife was the daughter of another pharaoh named Akhenaton. Akhenaton had tried to change the religion of ancient Egypt. He wanted Egyptians to have one god only, instead of many gods. Tutankhamen brought back the old religion with its many gods. He died at about age 18.

Tomb and Treasures

Workers dug Tutankhamen's tomb into a hillside in southern Egypt. The place is

called the Valley of the Kings. (By Tutankhamen's time, Egyptians had stopped burying pharaohs in pyramids.)

Thousands of years ago, robbers broke into the tombs of other pharaohs in the Valley of the Kings. They stole many treasures from the tombs. The robbers missed Tutankhamen's tomb because rubble from another tomb covered up the entrance.

In 1922 Howard Carter, a British archaeologist, found Tutankhamen's tomb and opened it. (An archaeologist is a scientist who studies things that people made in the past.) Carter found Tutankhamen's mummy, or preserved body, within a nest of three coffins. The inner coffin was solid gold. A gold mask with the face of the pharaoh covered the mummy's head. The tomb also con-

Tutankhamen's tomb was opened in 1922. One of the most spectacular objects in the tomb was a gold mask. It covered the head of the king's mummy.

tained furniture, statues, clothes, a chariot, weapons, staffs, and various other objects. The government of Egypt now owns these treasures.

Tutu, Desmond

Desmond Tutu is a religious leader in South Africa. His protests helped to bring an end to South Africa's apartheid laws. Apartheid was a system that kept blacks separate from whites. In 1984 Tutu received the Nobel peace prize for his work.

Early Life

Desmond Mpilo Tutu was born on October 7, 1931, in Klerksdorp, South Africa. His father was a schoolteacher. Tutu graduated from the University of South Africa in 1954.

Desmond Tutu

Tutu taught school for three years. Then he went back to college to study religion. In 1961 he became a priest in the Anglican church. He then taught religion in South Africa and Lesotho (another country in southern Africa).

Career

Between 1972 and 1975 Tutu worked in Great Britain for a Christian group called the World Council of Churches. Then he returned to Africa to serve the Anglican church.

Between 1978 and 1985 Tutu led the South African Council of Churches. During this time he frequently made nonviolent protests against apartheid laws. The apartheid system made life hard for blacks. They did not have the same rights as whites.

In 1986 Tutu became archbishop of Cape Town, South Africa. This made him the leader of South Africa's 1.6-million-member Anglican church. He was the first black to hold this job. In 1988 Tutu also became chancellor (president) of the University of the Western Cape in Bellville, South Africa. He continued to protest against apartheid.

Apartheid finally ended in the early 1990s. In 1995 Tutu led a committee that investigated the crimes of apartheid. He retired as archbishop in 1996, but he continued to teach.

Tuvalu

A traditional hut sits among palm trees on Funafuti Atoll in Tuvalu.

The country of Tuvalu is made up of nine small island groups in the Pacific Ocean. Tuvalu's capital is Vaiaku, on the island group called Funafuti Atoll.

Geography

Tuvalu is in Polynesia, a part of the large region called Oceania. Tuvalu's islands are made of coral. Five of the island groups are atolls. Atolls are groups of islets (small islands) that surround a pool of water. Most of Tuvalu's land is

only about 15 feet (4.5 meters) above sea level. There are no rivers. Tuvalu's climate is hot and rainy.

Plants and Animals

Coconut palms, screw pines, ferns, and grasses grow on the islands. Wildlife includes Polynesian rats, lizards, and turtles. Octopuses, crustaceans, and many fish live in Tuvalu's waters.

People

Almost all the people are Polynesians. Most people speak a language called Tuvaluan. English is also common. Most people are Christians. Nearly half of the population lives on Funafuti Atoll.

Economy

Most people work in agriculture and fishing. Crops include coconuts, tropical fruit, and sweet potatoes. Many people leave the country to find work. Tuvalu's government sells its stamps to stamp collectors around the world. Tuvalu also sells the use of its Internet name, ".tv."

History

The first settlers in Tuvalu came from the islands of Samoa in about the AD 1300s. In 1892 Great Britain took over Tuvalu, which was then called the Ellice Islands. In 1916 Britain joined the Ellice Islands with the Gilbert Islands (now the country of Kiribati). The Ellice Islands gained independence as Tuvalu in 1978.

Twain, Mark

The U.S. author Mark Twain wrote stories of youthful adventures. His stories are treasured by readers around the world. He created Tom Sawyer, Huck Finn, and other memorable characters.

Twain's real name was Samuel Langhorne Clemens. Mark Twain was the name he used as a writer. He was born on November 30, 1835, in the small town of Florida, Missouri. When he was 4 years old he moved with his family to Hannibal, Missouri, on the Mississippi River.

In 1847 Samuel's father died. From then on Samuel had to help support the family. At age 13 he started working with a local printer. Later he worked as a printer for newspapers in Saint Louis, Missouri; New York City; and Philadelphia, Pennsylvania. In the late 1850s

Mark Twain

and early 1860s he piloted steamboats on the Mississippi.

Clemens also wrote humorous stories for newspapers. In the 1860s he started writing under the name Mark Twain. In 1865 he published a story called "The Celebrated Jumping Frog of Calaveras County." It made him famous.

In the 1870s Twain settled with his family in Hartford, Connecticut. There he wrote his most famous books. He used his experiences growing up on the Mississippi River to write many of his stories. His novel *The Adventures of Tom Sawyer* (1876) is a story about a boy and his friends in a small river town. *The Adventures of Huckleberry Finn* (1884) tells of a boy's adventures as he floats down the Mississippi on a raft. *Huckleberry Finn* was his best book.

Late in life Twain lived mainly in Europe with his family. He died in Redding, Connecticut, on April 21, 1910.

Tyler, John

The 10th president of the United States, John Tyler did not win a presidential election. He took office after the death of President William Henry Harrison in 1841.

Early Life

John Tyler was born on March 29, 1790, at Greenway, his family's plantation near Richmond, Virginia. He was the son of Mary Armistead and John

John Tyler was the 10th president of the United States.

Tyler, Sr., a judge and former governor of Virginia.

After graduating from the College of William and Mary in 1807, Tyler became a lawyer at age 19. He married Letitia Christian in 1813. The couple had eight children.

Political Career

Tyler entered the Virginia legislature in 1811. In 1816 he was elected to the U.S. House of Representatives. He served again in the Virginia legislature before becoming governor of Virginia in 1825. Two years later he was elected to the U.S. Senate, where he served until 1836.

Although Tyler was a Democrat, he disagreed with Democratic president Andrew Jackson. He and many Southern Democrats joined the Whig Party. In 1840 the Whigs chose Tyler to run for vice president under Harrison. Harrison and Tyler won the election.

Presidency

President Harrison died just one month after taking office. He was the first president to die in office, and the Constitution did not say whether the vice president should become president or just act as president. Tyler decided that he was president.

TIMELINE

Tyler is born near Richmond, Virginia.

March 29, 1790

Tyler is elected vice president under William Henry Harrison.

1840

Tyler leaves office.

1845

Tyler dies in Richmond, Virginia.

January 18, 1862

Tyler becomes governor of Virginia.

1825

Tyler becomes president after Harrison dies.

1841

Tyler wins a seat in the Confederate Congress.

1861

Did You Know?

Tyler's enemies called him "His Accidency." They did not want anyone to forget that he had become president "by accident."

Neither the Whigs nor the Democrats supported Tyler. Still, he led Congress to reorganize the Navy and to establish the Weather Bureau. He ended an expensive war against the Seminole people in Florida. He also helped to stop a rebellion against the state government of Rhode Island in 1842. Finally, Tyler got Congress to agree to take over the Republic of Texas.

Tyler's wife died in 1842. In 1844 Tyler married Julia Gardiner. They had seven children.

Later Years

For the presidential election of 1844 Tyler created his own political party, but he soon dropped out of the race. He left office in 1845.

Tyler was a slave owner, but before the American Civil War (1861–65) he wanted to keep the Union together. When the war began, however, he supported the South and was elected to the Confederate House of Representatives. Before taking office, he died in Richmond on January 18, 1862.

Typhoid Fever

Typhoid fever is a serious disease. It is rare in wealthy countries but common in poor ones. People with the disease usually have a high fever for many days. Other symptoms, or signs, of typhoid

fever include headache, stomach pain, and weakness. A rash of rosy spots also may appear on the body.

Tiny living things called bacteria cause typhoid fever. The type of bacteria that causes the disease lives only in humans. It travels in the blood and attacks the intestines. It passes from person to person through water or food.

Typhoid fever may be prevented by keeping water supplies clean. Washing the hands before preparing food is important, too. People also may get a typhoid fever vaccine (a substance that prevents the disease) from a doctor or a nurse. People who do get the disease need to be treated with drugs called antibiotics. People who are not treated may die.

In the early 1900s a cook called Mary Mallon spread typhoid fever to at least 51 people in the United States. She carried the bacteria but did not get the disease. She passed the bacteria to people through food that she prepared. Mallon's actions earned her the nickname Typhoid Mary.

Typhus

Typhus is the name of several diseases caused by tiny living things called bacteria. The symptoms of typhus include headache, fever, and rash. Lice, fleas, mites, and ticks carry the types of bacteria that cause typhus. These bloodsuckers pass the bacteria to humans.

To prevent typhus, people should keep lice, fleas, mites, and ticks from getting on their skin. People also can get a vaccine, or substance that prevents the disease. If a person does get typhus, drugs called antibiotics can cure it.

Tyrannosaurus Rex

Tyrannosaurus rex, or *T. rex*, was one of the largest and most ferocious predators ever to walk on Earth. The name *Tyrannosaurus rex* means “king of the tyrant lizards.” *T. rex* was just one of the group of dinosaurs called tyrannosaurs. The tyrannosaurs were theropods, or meat-eating dinosaurs that walked on their two back legs.

When and Where

Tyrannosaurus rex Lived

T. rex lived about 80 to 65 million years ago. Fossil remains of *T. rex* have been found in the United States, Canada, and

Asia. Scientists believe that *T. rex* lived in forests and in forest clearings.

Physical Features

T. rex could reach a length of 42 feet (13 meters) and weighed up to 8 tons. Its huge head could reach 5 feet (1.5 meters) in length, and its skull alone weighed up to 600 pounds (270 kilograms). Its eyes allowed it to see forward and to the sides. *T. rex* had about 60 teeth with sawlike edges. It had muscular back legs, each with three clawed toes. *T. rex*'s front legs were tiny but very strong. Its tail was held off the ground.

Behavior

T. rex preyed on plant-eating dinosaurs. It most likely lunged out from behind trees in surprise attacks. It also may have hunted in packs to bring down much larger dinosaurs. Scientists estimate that *T. rex* could run 20 miles per hour (32 kilometers per hour) for short distances. *T. rex* also may have been a scavenger, feeding upon dead animals.

Uganda

Uganda is a country in East Africa. It takes its name from Buganda, which was a powerful African kingdom in the 1800s. Uganda's capital is Kampala.

Geography

Uganda shares borders with Sudan, Kenya, Tanzania, Rwanda, and the Democratic Republic of the Congo. Lake Victoria lies to the southeast. It is the world's second largest freshwater lake, after Lake Superior in North America.

Most of Uganda is on a plateau, or raised flat area. A huge natural ditch called the Western Rift Valley runs along the country's western border. Mountains rise in the west, north, and east. Uganda's rivers include the Victoria Nile and the Albert Nile. Uganda has a warm climate with rainy and dry seasons.

Mgahinga Gorilla National Park in southwestern Uganda is home to rare mountain gorillas.

Plants and Animals

Scattered tropical rain forests grow in southern Uganda. In the north tall grasses and clumps of trees cover the land.

Hippopotamuses and crocodiles live in most of Uganda's lakes. The country's wildlife also includes chimpanzees, elephants, lions, leopards, rhinoceroses, giraffes, and zebras. Rare mountain gorillas live in a national park in the southwest.

People

Dozens of different African peoples live in Uganda. Those who speak Bantu languages make up the largest part of the population. The Ganda people form the largest single group. Small numbers of

Asians, Europeans, and Arabs also live in Uganda.

Uganda's peoples speak more than 30 languages. English, Ganda (or Luganda), and Swahili are the most common languages. About two thirds of the people are Christians. Many other Ugandans practice Islam or traditional African religions. Most people live in rural areas.

Economy

Most of Uganda's people are farmers. The main crops include coffee, tea, cotton, and tobacco. People grow sweet potatoes, corn, peanuts, and beans for food. Farmers also raise cattle, sheep, goats, pigs, chickens, ducks, and turkeys. Fishing is another important source of food.

Industry is a small part of Uganda's economy. Many industries process farm products, including coffee, tea, tobacco, sugar, and cooking oils. Uganda also produces beer, soft drinks, cement,

Several houses stand on a hillside in a mountainous area of Uganda. Most of the country's people have homes in rural areas.

metal products, shoes, soap, and fabrics. The country's mines provide copper, cobalt, gold, and other minerals.

History

Small groups of farmers and herders moved into the Uganda region hundreds of years ago. West of Lake Victoria, the Bunyoro kingdom gained power at the end of the 1400s. By the 1800s, however, the Buganda kingdom had become the largest power in the region.

Arab traders reached the area in the 1840s. The first European explorers came to Buganda in 1862. Missionaries soon followed and began to teach Christianity. Great Britain took over Buganda in the 1890s.

In 1962 the region gained independence as the Republic of Uganda. In 1971 a military officer named Idi Amin seized control of the government. He ruled the country as a dictator, or a leader with unlimited power. The military government killed as many as 300,000 Ugandans during Amin's rule.

In 1979 Amin was forced to leave the country after making an unsuccessful attack on Tanzania. Uganda elected a president in 1980, but the military took control again in 1985. In 1986 a rebel leader named Yoweri Museveni became president. Other rebels tried to bring down his government, but he remained in power into the 21st century.

Ukraine

Ukraine is the second largest country in Europe, after Russia. Ukraine's capital is Kiev.

Geography

Ukraine shares borders with Moldova, Romania, Hungary, Slovakia, Poland, Belarus, and Russia. The Black Sea and the Sea of Azov lie to the south.

Almost all of Ukraine is flat. The grassland that covers the central and southern parts of the country is called the steppe. In northern Ukraine are the Pripet Marshes, the largest swamp in Europe. The Carpathian Mountains rise in the west. The Crimean Mountains cross the Crimean Peninsula, a piece of land that extends south into the Black Sea. Ukraine's longest river is the Dnieper.

Most of Ukraine has warm summers and cold winters. It rains mainly in June and July.

Cliffs on the Crimean Peninsula overlook the Black Sea. The peninsula is the most southern part of Ukraine.

Plants and Animals

Most of Ukraine's forests are in the mountains in the west. Some trees grow among the swamplands and in central Ukraine. The southern grassland has few trees. The country's animals include deer, wolves, bears, foxes, wildcats, beavers, weasels, and badgers.

People

Most of Ukraine's people are ethnic Ukrainians, but Russians form an important minority group. There are also small groups of Moldovans, Tatars, and Belarusians. Ukrainian is the main language. Most people live in cities or towns.

About half the people of Ukraine follow some form of Eastern Orthodox Christianity. Others are Ukrainian Catholics, Roman Catholics, Protestants, or Muslims. About one Ukrainian in six does not follow any religion.

Economy

Manufacturing and mining are both important to Ukraine's economy. Factories produce iron and steel, locomotives, tractors, chemicals, and other goods. Mines provide manganese, coal, iron ore, salt, sulfur, and other minerals. Ukraine also has reserves of natural gas and oil.

Farming is important to the economy, too. The main crops are potatoes, sugar beets, wheat, barley, corn, rye, and oats. Farmers also raise cattle, pigs, sheep, and goats.

History

Tribes of people called Slavs arrived in what is now Ukraine during the 400s and 500s. Viking invaders called Varangians later mixed with the Slavs. They set up a state that became the powerful kingdom of Kievan Rus. Kievan Rus lost power when Mongols invaded in the 1200s.

Poles and Cossacks

In the 1300s Lithuania took control of most of Ukraine. Poland ruled most of Ukraine after 1569. The Poles made many Ukrainians into serfs, or farmers who had to work on land that they did not own.

Some serfs escaped and joined a military force called the Cossacks. In 1648 the Cossacks led a fight against Polish rule. The Cossacks asked Russia to help them defeat the Poles. The Cossacks won independence from Poland, but their new state soon became part of the Russian Empire.

Folk dancers in traditional dress perform on a street in Ukraine.

Soviet Control

In the 1700s Russia slowly gained control over almost all of Ukraine. By 1922 Ukraine had become part of the newly formed Soviet Union. The Soviets took over Ukraine's farms. During the 1930s about 5 to 7 million Ukrainians died from starvation.

During World War II Germany invaded Ukraine. German forces made millions of Ukrainians into slaves and murdered about 600,000 Ukrainian Jews. The Soviets drove the Germans out of Ukraine in 1944.

Independence

In 1991 the Soviet Union broke apart, and Ukraine declared its independence. In 2004 many Ukrainians protested when Viktor Yushchenko lost the presidential election. They thought the election had been unfair. Ukraine then held a second election, and Yushchenko won.

Ulaanbaatar

Population
(2008 census)
1,031,200

Ulaanbaatar is the capital of Mongolia, a country in central Asia. It is the largest city in Mongolia by far. It lies on the Tuul River. Ulaanbaatar is one of the world's coldest capitals. Its average year-round temperature is only 27° F (−3° C).

Ulaanbaatar is one of Mongolia's industrial centers. Factories in the city make food products, fabrics, carpets, leather goods, and a luxury fiber called cashmere. Many people in Ulaanbaatar work

for the government or in trade or other service industries.

Buddhists built a religious center called the Da Khure monastery in what is now Ulaanbaatar in 1639. Over time a city grew around the monastery. It became a trade center on a route between China and Russia.

China controlled Mongolia for hundreds of years. In 1911 Mongolia became an independent country. Ulaanbaatar was made its capital in 1924. The city grew rapidly during the 1900s.

Ulster

Ulster was an ancient kingdom of Ireland. It covered the northern part of the island of Ireland. The name Ulster is now commonly used for Northern Ireland, a part of the United Kingdom.

Ulster was one of five Irish kingdoms created about 2,000 years ago by people called the Celts. In its early history, it was the most powerful of the kingdoms. It was ruled by Roman Catholic kings.

England took control of Ireland in the 1100s. In the late 1500s Ulster rebelled against England, but it was defeated. The English king then sent Protestant settlers from Scotland and England to Ulster. Ulster changed from Catholic to mostly Protestant. The religious differences led to fighting.

Elderly people gather outside a Buddhist religious center in Ulaanbaatar, Mongolia.

In the early 1900s southern Ireland moved toward independence from Great Britain. The Protestants of Ulster wanted to remain part of Britain. In 1920 Britain divided the island. Six of Ulster's nine counties remained under British rule. They became Northern Ireland. The other three counties joined the new country of Ireland.

Underground Railroad

The Underground Railroad was not an actual railway. Instead, it was a secret organization that existed in the United States before the Civil War. The people of the Underground Railroad helped escaped slaves from the South to reach places of safety in the North or in Canada.

The Underground Railroad used railway terms as code words. The routes to freedom were called “lines.” The hiding places on the lines were called “stations.” The people who moved or hid the slaves were called “conductors.” The slaves themselves were sometimes called “freight.”

The Underground Railroad had to be secret because it was against the law. Laws called the Fugitive Slave acts protected slaveholders' rights even in states that did not allow slavery. The people who ran the Underground Railroad were

A painting shows how the Underground Railroad in the United States moved enslaved Africans to freedom in the dark of night.

abolitionists—they wanted to abolish, or end, slavery in all states.

Many Underground Railroad conductors were followers of the Quaker religion. The Quaker leader Thomas Garrett is believed to have helped about 2,700 slaves escape. Other conductors were Northern blacks. Harriet Tubman, a former slave, led hundreds of slaves to freedom.

The heaviest activities of the Underground Railroad were in Pennsylvania, Ohio, Indiana, New York, and the New England states. Most routes ended in Canada. Estimates of the number of slaves who “rode” the Underground Railroad range from 40,000 to 100,000. The Railroad's activities ended with the beginning of the Civil War in 1861.

Unidentified Flying Object (UFO)

An unidentified flying object, or UFO, is anything in the sky that cannot be explained by the person who sees it. Some people think that UFOs are alien spaceships. But most scientists say that UFOs can be explained in much more ordinary ways.

Descriptions of UFOs have ranged from glowing wheels to colored balls of light to cigar-, crescent-, or disk-shaped objects. A sighting of disk-shaped UFOs in the 1940s led to the creation of the term flying saucers. It then became popular to call all UFOs flying saucers.

Clouds can often form strange shapes. Some people may see such a cloud and think that it looks like a flying saucer.

The U.S. government has kept records of thousands of UFO sightings. These records include photos of UFOs and recordings of interviews with people who claim to have seen them. In the 1950s scientists chosen by the government studied hundreds of sightings. Most of the sightings turned out to be space objects, such as stars, bright planets, or meteors. Many other sightings were aircraft, birds, or hot gases. Often these sightings happened in unusual weather conditions.

The scientists' findings did not stop UFO reports, however. By the mid-1960s UFO sightings were more numerous than ever. The U.S. government continued to say that UFOs were not evidence of alien life. Most scientists agreed. But some UFO sightings remained unexplained. Even today a few scientists believe that some UFOs could be visitors from outer space.

Union of Soviet Socialist Republics

The Union of Soviet Socialist Republics (U.S.S.R.), or Soviet Union, was the first country to form a government and an economy based on the system known as Communism. The Soviet Union was in existence for only about 70 years, from 1922 to 1991. For much of that time, however, it was one of the most powerful countries in the world.

The Russian republic was by far the largest of the 15 republics that made up the Soviet Union.

Land

The Soviet Union was the largest country that ever existed. It covered more than 8.6 million square miles (22.3 million square kilometers) in Europe and Asia—almost two and one half times the area of the United States.

The Soviet Union was made up of 15 states. The states were called republics. The largest and most powerful republic was the Russian Soviet Federated Socialist Republic, which is now called Russia. The modern names for the other republics are Estonia, Latvia, Lithuania, Belarus, Ukraine, Moldova, Georgia, Armenia, Azerbaijan, Kazakhstan, Turkmenistan, Uzbekistan, Tajikistan, and Kyrgyzstan. The capital of the Soviet Union was Moscow, which was also the capital of Russia.

People

In its last years, the Soviet Union had the world's third-largest population—more than 290 million people. The country had more than 100 groups of different peoples. Ethnic Russians made up the largest group by far. The next-largest groups were Ukrainians, Uzbeks, Belarusians, and Kazakhs. Russian was the official language, but more than 200 other languages existed in the country.

The Soviet government did not approve of religion. Even so, the Russian Orthodox Christian church survived. There were also many Muslims, or followers of Islam, in some republics.

During the time the Soviet Union existed, millions of people moved from farms to cities. By 1991, two out of

every three Soviet citizens lived in a city. Moscow, Leningrad (now Saint Petersburg), and Kiev (now in Ukraine) were the largest cities.

Culture

The government of the Soviet Union controlled all parts of life in the country. The people were not allowed to speak openly to oppose the government. During the late 1920s and 1930s the government even put a stop to free artistic expression. Artists and writers were allowed to say only good things about the Soviet system. The government put many artists and writers in prison. Others left the country.

A few Soviet writers still produced great work. Boris Pasternak won the Nobel prize for literature in 1958, and Aleksandr Solzhenitsyn won it in 1970. Pasternak had to refuse the award, and Solzhenitsyn was forced to leave the country.

The Soviet government built plain high-rise apartment buildings in Moscow and other big cities. The buildings were needed to house the many people who moved to the cities from farms.

"For the Defense of the U.S.S.R." is the message of a 1929 poster. It shows factories, warplanes, and soldiers on the march.

Economy

During its most powerful period, the Soviet Union had one of the world's strongest economies. Agriculture, mining, and heavy industry all made big contributions to national wealth. The government completed many large projects such as dams and canals.

According to Communist teachings, individuals should not be allowed to own businesses. So the government owned almost all businesses and factories in the Soviet Union. Communist Party leaders decided what kinds of products would be made and how much the people would pay for them. The system led to shortages of many of the products that people needed.

The Communist system was also supposed to give farmers and workers a fair share of the country's wealth. However, farmers suffered greatly when the gov-

ernment took their land and created large farms called collective farms. By the 1970s the Soviet Union had to buy food from other countries to feed its people.

History

The Soviet Union was originally the Russian Empire. The tsar, or emperor, fell from power in a revolution that took place in 1917. Later in the same year a group called the Bolsheviks came to power. This group, later renamed the Communist Party, fought other Russians in a civil war that lasted from 1918 to 1920. Vladimir Lenin led the Communists. The Communists won the war.

Early Years

On December 20, 1922, the Communists created the Union of Soviet Socialist Republics. Russia was one of its republics. The other republics were mostly regions of the former Russian Empire. They were home to various non-Russian groups.

Lenin died in 1924. A few years later, a Communist Party leader named Joseph Stalin came to power. Stalin was one of the cruelest rulers who ever lived. He killed farmers who did not want collective farms. He sold crops to foreign countries and let his own people starve. During the 1930s he caused as many as 10 million people in the Soviet Union to die.

World War II

In 1939, just before World War II began, Germany and the Soviet Union secretly agreed not to attack each other.

Germany then invaded Poland, which started the war. Germany and the Soviet Union divided Poland between them. The Soviet Union also took Latvia, Lithuania, and Estonia at this time and made them Soviet republics.

In June 1941, however, Germany broke the agreement and invaded the Soviet Union. The Soviet Union then joined the United States and Great Britain to fight Germany.

The Soviet Union suffered terribly during the war. By the time Germany surrendered in 1945 more than 20 million Soviet people had died.

Cold War

Despite all the damage it had suffered, the Soviet Union was still the greatest power in Europe after World War II. While fighting the Germans, Soviet troops moved into many countries in eastern Europe. Between 1945 and 1948 the Soviets set up Communist governments in these countries. They con-

The Communist Party leader Vladimir Lenin speaks to an outdoor gathering in 1920.

Each May Day (May 1) the Soviet government paraded missiles and other military weapons through Red Square in central Moscow.

trolled these governments. This activity worried many people in other countries, particularly the United States. Both countries built up their military forces. The rivalry between them came to be known as the Cold War.

The United States and the Soviet Union both developed nuclear weapons. Many people were afraid that this would lead to nuclear war. But neither country ever used the weapons.

Conditions improved for the Soviet people following Stalin's death in 1953. Over the next few years Nikita Khrushchev came to power. Khrushchev introduced some reforms that angered other Communist party leaders. In 1964 he lost power.

Some eastern European countries tried to take advantage of the reforms. They rose up against Soviet rule. To stop the uprisings, the Soviet Union invaded Hungary in 1956 and Czechoslovakia in 1968.

The Soviets invaded Afghanistan in 1979. Afghanistan is an Asian country that bordered the Soviet Union. Rebels there were trying to overthrow a Communist government. The United States supported the rebels. In 1989 the Soviet Union left Afghanistan in defeat.

Breakup

In 1985 Mikhail Gorbachev came to power. Gorbachev wanted to build a stronger economy and a freer society. His policies were called *glasnost*, which means "openness," and *perestroika*, which means "restructuring." But Gorbachev soon learned that the more freedom his people had, the more they wanted. Beginning in 1987 people in some of the Soviet republics began to demand independence.

In 1989 a series of almost completely peaceful revolutions began. The eastern European countries gained independence from Soviet control. During 1991 the Soviet republics also gained their independence. On the last day of that year, the Soviet Union came to an end. Fifteen separate countries replaced it.

United Arab Emirates

Boys get ready for a camel race in the United Arab Emirates.

The United Arab Emirates is a small, rich country in the Middle East. The capital is Abu Dhabi.

Geography

The country is a union of seven small kingdoms, or emirates. The emirate called Abu Dhabi takes up most of the country's land. It stretches along the Persian Gulf, to the north. The other six emirates are in the northeast. The coun-

try shares borders with Saudi Arabia and Oman. Most of the land is a flat desert.

Plants and Animals

Few plants grow in the desert. Date palm, mango, and guava trees grow near the coast. Snakes, lizards, foxes, hares, and gerbils live in the country.

People

Less than a quarter of the people in the United Arab Emirates are citizens. Most people are workers from other countries. Arabs make up about half of the population. South Asians form the next largest group. Most people are Muslims. Arabic is the main language.

Economy

The United Arab Emirates' economy depends on the sale of oil and natural gas. The country also produces chemicals, clothing, cement, metals, food products, and minerals.

History

For hundreds of years the region was divided among many tribes and kingdoms. In the 1800s the main tribal rulers signed peace agreements, or truces, with Great Britain. The region then became known as the Trucial States. The British left the region in 1971. Six emirates then joined together to form the United Arab Emirates. In 1972 a seventh emirate joined the country.

United Kingdom

The United Kingdom is a country of western Europe. It is made up of four parts: England, Scotland, Wales, and Northern Ireland. The country's full name is the United Kingdom of Great Britain and Northern Ireland. Sometimes the country is called Great Britain, or just Britain. The capital of the United Kingdom is London, in southeastern England.

Geography

The United Kingdom is an island country in the Atlantic Ocean. It lies off the northwestern coast of mainland

The United Kingdom has quiet villages, but most of its people live in large cities.

Europe. The country has land on two main islands. The island of Great Britain contains England, Scotland, and Wales. England covers most of the southern two thirds of Great Britain. Scotland takes up the northern third. Wales lies on the southwestern part of Great Britain.

The island of Ireland is west of Great Britain. Northern Ireland is in the northeastern part of this island. The country called Ireland takes up the rest of the island. It is not part of the United Kingdom.

Plants and Animals

The United Kingdom has forests in northeastern Scotland and southeastern England. Common trees include oak, elm, ash, beech, pine, and birch. Some parts of Scotland and Northern Ireland have large areas of peat moss and heather.

Deer, badgers, otters, foxes, and weasels live in rural areas. Rabbits, rodents, hedgehogs, moles, and shrews are common. Birds include sparrows, blackbirds, chaffinches, and starlings.

People

The people of the United Kingdom are called the British. Most of them are descendants of early settlers from mainland Europe. More than four fifths of the people live in England. The population also includes people from places that the United Kingdom once ruled as colonies. Many of these people have roots in India, Pakistan, Bangladesh, the West Indies, and Africa.

English is the most common language in the United Kingdom. Some people speak Welsh, Scottish Gaelic, or Irish Gaelic.

About two thirds of the people are Christian. Of these, most belong to Protestant churches. The United King-

exports, or sells to other countries, electrical equipment, automobiles, aircraft, petroleum (oil), and iron and steel products. The United Kingdom also has important paper, printing, and publishing industries. The main crops include barley, wheat, sugar beets, and potatoes. Farmers also raise cattle, sheep, and pigs.

History

The United Kingdom was invaded many times in its early history. By about 300 BC people called Celts had arrived on the islands of Great Britain and Ireland. They came from mainland Europe. The Romans came in the 1st century BC. England and Wales were part of the Roman Empire until the AD 400s. Then peoples called Angles, Saxons, and Jutes invaded from

northern Germany. They settled throughout England. Eventually all the people of England came to be known as Anglo-Saxons.

In the 700s and 800s Vikings from northern Europe raided the coasts of England. In the late 800s the Anglo-Saxons defeated the Vikings. Then, in the 900s, the Anglo-Saxons established a united English kingdom for the first time.

Growth of the Kingdom

The English kingdom grew through conquests over hundreds of years. In the late 1200s the king of England seized Wales. Before that, Wales had been a collection of Celtic kingdoms. In 1536 the English Parliament, a group of lawmakers, officially united Wales with England.

The ruins of a Roman Catholic abbey stand in a field in northern England. King Henry VIII broke away from the Roman Catholic church in the 1500s. He ordered Catholic monks to leave the monasteries where they lived and worked. He also founded a new Protestant church called the Church of England. Today most people in the United Kingdom are Protestant.

England were joined. The newly united country, which consisted of England, Scotland, and Wales, was called the kingdom of Great Britain. The people of the kingdom were called the British.

England conquered much of Ireland in the late 1100s. The people of Ireland, like the people of Scotland, resisted English rule. But by the end of the 1600s England had firm control of the

island. Ireland was officially joined to England, Scotland, and Wales in 1801. It was called the United Kingdom of Great Britain and Ireland.

The British Empire

Many years earlier England had begun to establish settlements called colonies in other parts of the world. People from England started settling in North America and Asia in the 1600s. Later others settled in Africa and other places. All the colonies and lands that were ruled by England came to be known as the British Empire.

Great Britain lost its American colonies as a result of the American Revolution (1775–83). But the United Kingdom still became one of the richest and most powerful countries in the world. During the reign of Queen Victoria (1837–1901) the British Empire included more than one fourth of the world's people.

Conflict in Ireland

Many Irish people did not want Ireland to be part of the United Kingdom. One concern was that most Irish people were Roman Catholic while most English were Protestant. The English government established anti-Catholic laws in both Britain and Ireland. For example, Catholics were not allowed to hold public office for many years.

After years of fighting, most of Ireland's counties split from the United Kingdom in 1921. They formed the Irish Free State (now Ireland). But six northern counties remained part of the United Kingdom as Northern Ireland. The

country was renamed the United Kingdom of Great Britain and Northern Ireland. Some people in Northern Ireland continued to fight against British rule through the 20th century.

Later Years

The United Kingdom was on the winning side in both World War I (1914–18) and World War II (1939–45). After World War I Britain won new lands from the defeated countries as the result of peace treaties. Prime Minister Winston Churchill gave Britain strong leadership during World War II. But British cities were heavily damaged. The United Kingdom spent years rebuilding its economy.

After World War II Britain gave up most of its lands in other parts of the world. Almost all the former colonies, however, chose to maintain ties with Britain. They remained members of a British organization called the Commonwealth.

For many years the people of Wales, Scotland, and Northern Ireland asked for more self-rule. During the 1990s the British government finally allowed the three to form their own parliaments. The national Parliament in London, however, continued to govern the United Kingdom as a whole.

United Nations

The United Nations is an organization that includes almost all the world's countries, or nations. It is called the UN for short. By the 21st century the United Nations had more than 190 members. The main goal of the United Nations is world peace. The United Nations also works to reduce poverty and suffering and to improve people's lives in other ways.

Functions

The United Nations tries to find peaceful solutions to disagreements between countries. If fighting breaks out, the United Nations sometimes sends in military troops to try to stop it.

After a war, UN organizations provide money to help countries rebuild. They also give poor countries money to help build up their economies.

The United Nations helps refugees—people who have left their countries to avoid danger or mistreatment. The United Nations also tries to protect

United Nations troops patrol an area in order to help keep the peace.

human rights. The United Nations Universal Declaration of Human Rights, written in 1948, describes those rights. The United Nations also tries to make sure that everyone gets equal treatment regardless of race, sex, language, or religion.

Divisions

The United Nations has six main parts. They are the General Assembly, the Security Council, the International Court of Justice, the Secretariat, the Economic and Social Council, and the Trusteeship Council. The Trusteeship Council is no longer active.

The General Assembly discusses all kinds of issues that affect member countries. It has representatives from UN members. Each member has one vote. To decide important questions, at least two thirds of the members must agree.

The Security Council looks into disagreements between countries and suggests ways to settle them peacefully. Only 15 countries belong to the Security Council at any one time. Five countries belong permanently. They are the United States, Great Britain, France, Russia, and China. All five permanent members must agree before the Security Council can take action.

The International Court of Justice hears disputes between countries. It is commonly called the World Court. Any member country can bring a case before the court, which has 15 judges.

Some United Nations Agencies and Programs		
Specialized Agencies	Abbreviation	Goals
International Labour Organization	ILO	To improve working conditions for workers worldwide
Food and Agriculture Organization of the UN	FAO	To improve farming, forestry, and fishing practices; to ensure that all people have enough to eat
UN Educational, Scientific and Cultural Organization	UNESCO	To promote education for all; to protect nature and the world's cultures; to promote international cooperation in science; to ensure freedom of speech
World Health Organization	WHO	To ensure all people are as healthy as possible
World Bank Group		To give loans and technical help to developing countries
Other Programs and Funds		
United Nations Environment Programme	UNEP	To help countries protect the environment
United Nations Children's Fund	UNICEF	To help children worldwide be safe, healthy, and educated
Office of the United Nations High Commissioner for Refugees	UNHCR	To protect refugees (people who were forced to leave their country)
World Food Programme	WFP	To get emergency food supplies to people who need them
Source: United Nations		

The Secretariat helps to carry out UN decisions. People from almost every member country work in its offices. An official called the secretary-general runs the Secretariat and speaks for the United Nations.

The Economic and Social Council tries to improve social services such as health and education. Other groups called specialized agencies help it in its work.

History

The United States, Great Britain, and the Soviet Union planned the United Nations. They wanted a new group to take the place of the League of Nations.

The League had been formed to keep peace after World War I (1914–18). However, it was not powerful enough to prevent World War II (1939–45).

In April 1945, near the end of World War II, people from 50 countries met in San Francisco, California, to organize the United Nations. In June they completed the United Nations Charter, or founding document. On October 24, 1945, the United Nations officially began work.

United States

A nighttime view of Washington, D.C., shows the Lincoln Memorial in the foreground, the tall Washington Monument, and the U.S. Capitol in the background.

Established in 1776, the United States is young compared to many other countries. Yet by the 1900s the United States had grown into a world power. The capital is Washington, D.C.

Geography

The United States is the fourth largest country in the world (after Russia, Canada, and China). It extends across North America from the Atlantic Ocean on the east to the Pacific Ocean on the west. The United States is made up of 50 states and the District of Columbia. Forty-eight of the states lie between Canada on the north and Mexico and the Gulf of Mexico on the south. The 49th state, Alaska, lies northwest of

Canada. The 50th state, Hawaii, is a group of islands in the Pacific Ocean.

The landscape of the United States ranges from rugged mountains to flat prairies and from moist rain forests to dry deserts. The mountain ranges include the Rocky Mountains and the Sierra Nevada in the west and the Appalachian Mountains in the east. Between the Appalachians and the Rocky Mountains is a vast lowland region that includes the Great Plains. The highest point in the country is Mount McKinley, in Alaska. It is 20,320 feet (6,194 meters) high. The lowest point is Death Valley, in the California desert. It lies 282 feet (86 meters) below sea level.

The United States has some of the largest and most useful rivers and lakes in

Boaters enjoy a view of Yosemite Falls in Yosemite National Park in California.

Prairies once covered large parts of the central United States. Much of the land is now used for farming or grazing. But there are still areas where grasses cover the hills.

the world. The longest rivers are the Mississippi and the Missouri. They join in the middle of the country. The combined Mississippi-Missouri river system is 3,710 miles (5,971 kilometers) long. The five Great Lakes form the largest connected area of freshwater on Earth.

The climate of the United States is as varied as its land. It ranges from Arctic cold in Alaska to tropical warmth in Hawaii and southern Florida.

Plants and Animals

Forests in the eastern United States have pine, hemlock, oak, hickory, birch, and maple trees. Pine, fir, and spruce forests are common in the Rocky Mountains and along the Pacific coast. Grasslands cover large parts of the central plains. Sagebrush, yucca, and cactus are common in the deserts of the Southwest.

The animals of the forest include bears, elk, deer, foxes, bobcats, beavers, opossums, and raccoons. Coyotes, prairie

dogs, jackrabbits, and a few bison (buffalo) live on the grasslands. Desert animals include snakes, lizards, scorpions, and roadrunners.

People

The United States is made up of people from many backgrounds. Whites make up more than 70 percent of the population. They have roots in Great Britain, Ireland, Germany, Italy, Poland, Russia, Sweden, and other European countries. The two largest minority groups are African Americans and Hispanic Americans. Asian Americans, Pacific Islanders, and Native Americans make up small groups. Most Americans speak English. The country also has many Spanish speakers because of its large Hispanic population.

More than four fifths of the population is Christian. Protestants are the largest Christian group, followed by Roman Catholics. Other people practice Islam, Judaism, Buddhism, and Hinduism.

More than three fourths of the people live in or near cities. New York City, on

the East Coast, is one of the largest cities in the world. Los Angeles, California, and Chicago, Illinois, are the country's next largest cities.

Economy

The United States is a great economic power. Service industries make up the largest part of the economy. They include finance, health care, education, and tourism. Major manufactured products include iron and steel, chemicals, electronics, motor vehicles, aircraft, and food.

The United States is rich in resources. Its farmlands produce corn, soybeans, wheat, cotton, and many other crops that are sold to countries all over the world. The United States is among the world's leading producers of several minerals, including copper, silver, zinc, gold, coal, petroleum (oil), and natural gas. Forestry and fishing are important industries, too.

A large pipe carries petroleum across the U.S. state of Alaska.

The United States is often called a melting pot because it is made up of people of many different cultures.

History

The first people to live in the Americas were the Native Americans. The first Native Americans probably came from Asia beginning about 60,000 years ago. By the 1400s there were about 200 different groups of Native Americans living on the land that became the United States.

The history of the Americas changed forever in 1492 when Christopher Columbus sailed there from Spain. After Columbus' voyage, many other explorers and settlers came from Europe. The Native Americans suffered. Some died from diseases carried by the Europeans. Others died fighting the Europeans.

Colonies

The first lasting European settlement in what is now the United States was Saint Augustine, Florida. It was built by the Spanish in 1565. The Spanish made Florida and what is now the southwestern United States into colonies. The

taxes. The colonists protested. Tension built up between Britain and the colonies.

The English founded their first lasting settlement in North America in 1607. It was Jamestown, in what was later the state of Virginia. Then the English built other settlements and seized colonies from the Dutch. Soon there were 13 English colonies along the Atlantic coast.

In 1775 fighting broke out between colonists and British forces in Concord and Lexington, Massachusetts. These battles began the American Revolution. On July 4, 1776, the colonies approved the Declaration of Independence. This document made the colonies into the United States.

In 1700 about 250,000 people lived in the 13 colonies. By 1760 the population was nearly 1.7 million. Many of the newcomers were Africans who were brought to work as slaves, especially in the South.

The American Revolution continued until the British surrendered in 1781. By signing a treaty in 1783, Britain accepted the independence of the United States.

American Revolution

In the 1760s the British government started to tighten its control over the colonies. Parliament, the British legislature, forced the colonists to pay new

The New Country

In 1787 representatives from the states met in Philadelphia, Pennsylvania. The meeting produced a document that outlined a new government. The document was the U.S. Constitution. It took effect

in 1789. George Washington became the country's first president.

The United States soon began to grow. In 1803 President Thomas Jefferson bought the Louisiana Territory from France. The purchase added a vast area west of the Mississippi River to the United States. In 1819 the United States acquired Florida from Spain.

Texas became a state in 1845. The United States and Mexico disagreed over the border between Texas and Mexico. In 1846 the countries went to war. The Mexican War lasted until 1848. The United States defeated Mexico and took over California and the rest of the Southwest.

Civil War and Reconstruction

In the middle of the 1800s slavery divided the United States. Southern farms depended on slave labor, but many Northerners were strongly against slavery. In 1860 Abraham Lincoln was elected president. His party, the Republicans, opposed slavery. After Lincoln's election, the Southern states began to secede (withdraw) from the United States. They formed their own government. It was called the Confederate States of America, or the Confederacy.

In 1861 war broke out between the U.S. government, called the Union, and the Confederacy. This was the American Civil War. The Confederacy won most of the early battles, but by 1864 the Union was winning. In 1865 the Confederate general Robert E. Lee surrendered.

In 1987 the United States celebrated the 200th anniversary of the creation of the U.S. Constitution. As part of the celebration a group of men dressed as soldiers from the 1700s and carried flags of that time period.

The period after the Civil War is known as Reconstruction. The Republican leaders of Congress passed harsh laws to punish the South. These laws angered many Southern whites. And even though the war had ended slavery, African Americans still struggled. Many became poor farmworkers.

Growth of the Country

In the late 1800s the population of the United States grew as more people arrived from Europe. Many of them settled in cities and took jobs in factories. In the 1880s and 1890s industrial production more than doubled.

As Eastern cities grew, more people moved west. In a series of wars, settlers and the U.S. Army forced Native Americans to move onto reservations. The final defeat of the Native Americans came in the battle of Wounded Knee in South Dakota in 1890.

*Starting with John Adams, U.S. presidents have been elected as members of a particular political party.

By the end of the 1800s the reach of the United States extended to faraway territories. The United States bought Alaska in 1867 and claimed Hawaii in 1898. Also in 1898 the United States defeated Spain in the Spanish-American War. The United States took over Spain's colonies of Puerto Rico, Guam, and the Philippines. The United States was then a world power.

World Wars and the Depression

In 1914 World War I broke out in Europe. The United States entered the war in 1917. The American side, called the Allies, won the war in 1918.

During the 1920s the United States enjoyed peace and economic good times. But in 1929 a “crash” in the stock market started a serious economic downturn called the Great Depression. Many people lost their jobs and their savings. In the 1930s President Franklin D. Roosevelt started programs that helped businesses and farmers and gave people jobs. The programs were called the New Deal. By 1940 the United States was coming out of the Depression.

The next big challenge was World War II, which began in 1939 in Europe. The countries of Germany, Italy, and Japan were called the Axis powers. The other side included Britain, France, and the Soviet Union. They were called the Allies. On December 7, 1941, Japanese planes bombed a U.S. naval base at Pearl Harbor, Hawaii. Then the United States entered the war on the side of the Allies.

U.S. forces fought in Europe and North Africa and on islands in the Pacific Ocean. The war in Europe ended in May 1945, when Germany surrendered. The war in the Pacific ended in August 1945, after the United States dropped nuclear bombs on the Japanese cities of Hiroshima and Nagasaki.

The Cold War

After World War II the United States became involved in a tense rivalry with the Soviet Union. The Soviet Union had a Communist government. The United States wanted to keep Communism from spreading to other countries. This rivalry became known as the Cold War.

The first major conflict over Communism was the Korean War. In 1950 Communist troops from North Korea invaded South Korea. U.S. forces helped South Korea fight the Communists. The fighting lasted until 1953.

The Vietnam War was another fight over Communism. Starting in the 1950s Communist rebels tried to overthrow the government of South Vietnam. The United States helped South Vietnam. Many people protested against the war. U.S. troops gradually left Vietnam in the early 1970s.

Civil Rights

In the 1950s and 1960s African Americans struggled to gain better treatment. Their efforts became known as the civil rights movement. A minister named Martin Luther King, Jr., led nonviolent protests against segregation, or separation. The Civil Rights Act of 1964

finally guaranteed many rights to African Americans.

After the Cold War

Relations between the United States and the Soviet Union improved in the 1980s. In 1991 the Soviet Union broke up, ending the Cold War.

In the early 21st century the United States worried more about threats from terrorists than from other countries. In 2001 members of a terrorist group called al-Qaeda hijacked (seized) four airplanes and crashed three into buildings. The attacks killed nearly 3,000 people.

After the attacks President George W. Bush announced a “war on terror.” The United States attacked Afghanistan in 2001 and Iraq in 2003. Bush accused the leaders of both countries of supporting terrorism.

In 2008 the United States elected its first African American president. The new president, Barack Obama, faced many difficulties. They included the ongoing wars in Iraq and Afghanistan and a troubled economy at home.

United States Constitution

The United States Constitution is the most basic law of the United States. All other laws—including local, state, and U.S. laws—must agree with the U.S. Constitution.

History

No other country has a written constitution that is older than the U.S. Constitution. However, the Constitution was a replacement for an even older set of rules called the Articles of Confederation.

The articles were written when the United States first became a country. But there were problems with the articles. In 1787 people met in Philadelphia, Pennsylvania, to change them. They soon wrote a completely new document—the Constitution. Alexander Hamilton and others then wrote essays known as the Federalist papers to explain the new Constitution.

A painting shows members of the Constitutional Convention signing the United States Constitution in 1787.

During this time, the United States had 13 states. The Constitution went into effect on March 4, 1789, after nine states had approved it. All 13 states approved it by 1790.

Federal System

The Constitution gave the United States a federal system. In a federal system different levels of government share power. In the United States the national, or federal, government shares power with the governments of the states. Even so, the national government gained more power under the new Constitution than it had had under the Articles of Confederation.

Separation of Powers

The writers of the Constitution also wanted U.S. government leaders to share power with each other. So they separated the government into three equal branches—legislative, executive, and judicial.

Checks and Balances

Each branch has some power over the others. This is called a system of checks and balances. For example, the leader of the executive branch (the president) gets to appoint, or choose, many government leaders. But part of the legislative branch (the Senate) has the power to reject the president's choices.

Amendments

The Constitution can be changed. Changes are called amendments. Amending the Constitution is hard to do. Two thirds of each house of Con-

gress and three fourths of the states must approve every amendment.

The first 10 amendments went into effect in 1791, only two years after the Constitution became official. Those amendments are called the Bill of Rights. Only 17 other amendments have been added to the Constitution since 1791.

• Bill of Rights • Federalist Papers

United States Government

The United States government gets its powers from the United States Constitution. The Constitution organized the government into three equal branches—legislative, executive, and judicial.

Legislative Branch

The legislative branch of a government holds the power to make laws. In the United States, Congress is the legislative branch. Congress also has the power to declare war. A few legislative agencies, like the Library of Congress, help Congress in its work.

Members of Congress

Congress consists of two groups called houses. One house is the Senate. There are 100 senators, two from each state. The other house is the House of Representatives, or House. There are 435 representatives in the House. The number

U.S. senators and representatives gather in the chamber, or meeting room, of the House of Representatives to hear a foreign leader speak.

of representatives from each state is based on the state's population. States with large populations have more representatives than states with small populations.

Senators serve six-year terms. All voters in a state elect both senators from that state. States that have more than one representative, however, are divided into districts. People vote only for the representative from the district in which they live. Representatives serve two-year terms.

Both houses of Congress have leaders. The House leader is called the speaker of the House. The political party that has the most members in the House—called the majority party—chooses the speaker. The Senate leader is called the president of the Senate. The vice president of the United States serves as president of the Senate but votes only to break a tie. A senator called the president pro tempore leads the Senate

when the vice president is absent. The majority party in the Senate chooses the president pro tempore.

How Congress Makes Laws

A new law starts out as a document called a bill. First a member of the House or the Senate introduces a bill. Then it goes to a small group of representatives or senators called a committee. There are many committees. Committees have the power to make changes in bills. They also decide which bills the whole House or Senate will vote on.

Did You Know?

A member of Congress introduces a bill by dropping it into a box called the hopper.

Once the bill is ready, the House or the Senate votes on it. If more than half of the members who vote on a bill approve it, the bill passes, or gets approved. It then goes to the other house for approval. In order to become a law, a bill must be passed by both houses.

A bill passed by both houses goes to the president of the United States. If the president signs the bill, it becomes a law. However, the president can veto, or reject, a bill. A vetoed bill can still become a law, however. This happens if two thirds of both houses of Congress vote to override, or undo, the veto.

Executive Branch

The executive branch puts into use the laws that the legislative branch makes. The president of the United States leads the executive branch.

The President

Presidents serve four-year terms. Since 1951 presidents have been limited to

The Oval Office in the White House is the workplace of the president of the United States.

two terms. The vice president takes over if the president dies, gives up the job, or is unable to serve.

A group called the electoral college elects the president and the vice president every four years. Voters in a national election tell the electoral college members from their state how to vote.

Congress can accuse the president of breaking the law. This is called impeachment. The Senate decides whether the president is guilty. A guilty president must resign, or step down. Congress has impeached two presidents—Andrew Johnson and Bill Clinton—but the Senate found them both not guilty.

Executive Power

The president decides what the government should do. This is called making policy. A part of making policy is recommending laws for Congress to pass. Another part is dealing with foreign countries. As commander in

chief of the armed forces, the president can send soldiers into battle in foreign countries. However, only Congress may declare war.

The president also oversees the departments and government agencies that are part of the executive branch. These groups carry out laws and policies of all kinds.

After the Department of Homeland Security was created in 2002, there were 15 departments in all. The president appoints their leaders. The leaders form a group that is called the Cabinet. The Cabinet gives advice to the President.

Judicial Branch

The judicial branch, or judiciary, is a system of courts. Officials called judges run the courts. The courts use the U.S. Constitution and other laws of the U.S. government to settle cases.

The president of the United States appoints all federal judges, but the Senate must approve them. Once approved, the judges serve until death or retirement. Federal judges, like presidents, can be impeached.

Lower Courts

The district courts are the lowest level of U.S. courts. District court trials usually

Executive Departments	
Department	Important Duties
Department of Agriculture	Helps farmers; works to improve farming
Department of Commerce	Works to protect businesses; carries out census
Department of Defense	Oversees the armed forces
Department of Education	Works to improve education
Department of Energy	Manages the use of energy, including nuclear energy and fossil fuels
Department of Health and Human Services	Oversees social security programs; ensures that food and drugs are safe
Department of Homeland Security	Works to prevent terrorism in the United States and protect national borders
Department of Housing and Urban Development	Works to improve housing and public areas of cities
Department of the Interior	Oversees national parks and Native American affairs
Department of Justice	Fights crime; oversees national prisons
Department of Labor	Carries out laws that protect workers
Department of State	Deals with foreign countries; protects U.S. citizens outside the United States
Department of Transportation	Works to keep highway, railroad, and airplane travel safe and well organized
Department of the Treasury	Collects taxes; pays the government's bills; prints money
Department of Veterans Affairs	Helps veterans (people who have served in the U.S. armed forces)
Note: The heads of these departments belong to the president's Cabinet. Source: The White House (http://www.whitehouse.gov)	

The president of the United States oversees the 15 departments of the executive branch.

John G. Roberts, Jr., appears before a U.S. Senate committee. Roberts was the president's choice to be chief justice of the United States, or chief judge of the Supreme Court. But he could not start work until the Senate had approved him. Each branch of government has some power over the other two.

feature a jury and witnesses. A person who loses a case in a district court can appeal, or challenge, the decision in a circuit court of appeals. Panels, or groups, of judges usually hear cases in courts of appeals. They have the power to overturn, or undo, the judgments of the lower courts.

Supreme Court

The Supreme Court is the highest court in the United States. The nine judges on the Supreme Court are called justices. One is the chief justice. The others are associate justices.

Most of the cases that the Court hears are appeals of cases that lower courts have already decided. The justices vote on which cases they will hear.

When the Court hears a case, lawyers for both sides get a chance to speak. But there are no witnesses, and there is no

jury. After hearing the case, the justices meet in private to make a decision. A majority of the justices must agree before the Court can make its decision.

One justice writes a statement called an opinion to explain the decision. Justices who disagree with the decision can write their own opinions, which are called dissenting opinions. Judges on lower courts often use Supreme Court opinions to decide later cases.

A Supreme Court decision may be reversed by amending, or changing, the Constitution. The Court also may reverse one of its own decisions in a later case. For example, in 1896 it allowed segregation (forced separation of blacks and whites) in public places. Then in 1954, in the case of *Brown vs. Board of Education of Topeka*, the Court ruled that segregation of public schools was illegal.

Judicial Review

The Supreme Court has the power to overturn a U.S. law or a state law that does not follow the U.S. Constitution.

The nine members of the U.S. Supreme Court are called justices. They wear robes in their courtroom.

The Court declares such laws to be unconstitutional. This power, called judicial review, is not mentioned in the Constitution. The Court first used judicial review in 1803, in a case called *Marbury vs. Madison*.

Universe

The universe is everything that exists, including objects and energy, throughout time and space. Earth, the sun, and the rest of the solar system are only a very small part of the universe. The size of the universe is difficult to imagine. It is so large that light from very distant objects in the universe must travel billions of years before reaching Earth.

The universe is also called the cosmos. Cosmology is the branch of science that studies the universe as a whole. Astronomy is another name for the study of the universe.

The Milky Way and Other Galaxies

The sun is in a group of stars known as the Milky Way galaxy. A galaxy is a large system of stars, gas, and dust. Until the early 1900s scientists did not know for certain that there were galaxies outside the Milky Way. By using powerful telescopes, scientists now estimate that the universe has billions of galaxies.

A picture taken from the Hubble Space Telescope shows a galaxy called the Small Magellanic Cloud. New stars are forming from the galaxy's hot gas and dust.

The Milky Way galaxy alone contains more than 100 billion stars. Some galaxies are larger, and some are much smaller. But even small galaxies contain hundreds of millions of stars. Galaxies have a variety of shapes. For example, some galaxies have the shape of a pinwheel.

The Expanding Universe

Most scientists believe that the universe began suddenly in an event called the big bang. They estimate that this happened between 10 and 15 billion years ago. At first the universe was tightly packed and hot. In the time since then it has expanded and cooled off. Clouds of matter have come together to form stars, planets, and other objects in space. Some scientists believe that the universe may stop expanding and begin to

contract. But most scientists believe that the universe will keep expanding forever.

Ural Mountains

The Ural Mountains of Russia form the traditional boundary between Europe and Asia. The Urals are about 1,550 miles (2,500 kilometers) long. They extend from the Kara Sea in the north to the Ural River in the south. The highest peak is Mount Narodnaya at 6,217 feet (1,895 meters).

The northern slopes of the Urals are mostly covered with forests. Common trees include oak, linden, elm, fir, pine, and spruce. Treeless land called tundra is found in the far north, especially at high elevations. Arctic foxes, reindeer, brown bears, lynx, wolverines, and elk are among the animals of the range.

The economy of the Urals depends on mineral supplies. Mountain mines produce iron ore, copper, chromite, gold, silver, and platinum. Factories make

The Belaya River runs through the southern part of Russia's Ural Mountains.

metal goods, chemicals, and machinery. The huge forests of the Urals provide valuable wood. Farmers in the south grow wheat, buckwheat, millet, potatoes, and vegetables.

Russians entered the northern Urals in the late 1000s. However, they did not discover the range's mineral riches until the 1600s. In the 1700s the Urals became one of Russia's most important industrial areas.

Uranus

Uranus was the first planet to be discovered after the invention of the telescope. It is the seventh planet from the sun. It travels around the sun at an average dis-

tance of about 1.8 billion miles (2.9 billion kilometers).

Physical Features

Uranus is the third largest planet in the solar system. Its diameter, or distance through its center, is about 32,000 miles (51,000 kilometers). That is about four times the diameter of Earth. Uranus is most similar in size to Neptune, its outer neighbor.

Uranus is one of the planets that are called gas giants. It is made up mostly of gases, mainly hydrogen and helium. Small amounts of the gas methane give the planet a blue-green color. Uranus has no solid surface. Underneath its huge layers of gases, it has a smaller area of thick, hot liquid.

Narrow rings surround Uranus. These rings seem very unlike the bright, icy rings of the planet Saturn. The rings that

The spacecraft Voyager 2 photographed the gassy planet Uranus in 1986. Experts changed the colors in the image in order to make the details easier to see.

surround Uranus are made of some unusually dark material.

Orbit and Spin

Like all planets, Uranus has two types of motion: orbit and spin. Uranus orbits, or travels around, the sun. It takes about 84 Earth years to complete one orbit. In other words, a year on Uranus equals about 84 Earth years.

Uranus spins about its center in an unusual way. It is tilted so that it spins nearly on its side. Also, Uranus is one of the few planets in the solar system to spin in a clockwise direction. Uranus completes one rotation in about 17 hours, so a day on Uranus lasts about 17 hours.

Moons

More than 25 moons orbit Uranus. Its five major moons are Oberon, Titania, Ariel, Umbriel, and Miranda. They seem to be composed of ice and rock. Some of them have deep valleys and many large pits called craters.

Observation and Exploration

Uranus cannot be seen from Earth without the use of a telescope. The astronomer William Herschel discovered Uranus using his telescope in 1781. Uranus' rings were discovered in 1977.

Only one spacecraft has visited the distant planet. The unmanned U.S. spacecraft Voyager 2 flew by Uranus in 1986.

Did You Know?

Sometimes storms occur on Uranus. However, Uranus seems to have fewer storms than the other gas giants do.

Urinary System

Humans need vitamins, minerals, and other parts of foods and drinks in order to live. As the body uses these things, it creates substances that are not needed. To stay healthy, the body must get rid of these substances, called waste. The digestive system forms solid waste from food. Solid waste leaves the body through the anus, at the end of the large intestine. The urinary system forms liquid waste, or urine, in the kidneys. The bladder stores this urine until it leaves the body through a tube called the urethra.

Kidneys

In human beings and most other animals the blood absorbs the wastes created by the body. The blood carries these wastes into two bean-shaped organs

called kidneys. The kidneys sit behind the stomach on each side of the spine.

Kidneys do several things. They take out any useful substances from the blood and return them to the bloodstream. They also take out liquid wastes and extra water from the blood. The kidneys then combine the wastes and the water to make urine.

Bladder

Urine travels from each kidney down a tube called a ureter. The two ureters lead to the bladder. The bladder is a muscular organ that expands like a balloon as it fills with urine.

Urination

When the bladder is full, nerve endings in the bladder send a message to the brain. This message lets the person know that the bladder needs to be emptied.

Blood containing waste enters a kidney. Within the kidney, tiny units called nephrons create urine from waste and water in the blood. The blood then exits the kidney without the waste. The urine leaves the kidney through a tube called the ureter.

Humans learn as children how to hold in the urine by tightening nearby muscles. When the muscles relax, urine passes out of the bladder. It flows through a tube called the urethra and out of the body. This process is called urination.

Problems with the Urinary System

Like other parts of the body, the organs of the urinary system may become infected. This can make urination painful. Several diseases can cause the kidneys to stop working correctly. Wastes then build up in the body and make the person sick.

If the kidneys fail, doctors may use a technique called dialysis to remove wastes from the blood. In dialysis the patient's blood travels out of the body, through a cleaning machine, and back into the body. Doctors may also transplant a healthy person's kidney into the patient.

Urinary Systems in Other Animals

Like humans, most animals with a backbone have kidneys and a bladder. However, in birds, reptiles, and amphibians, urine collects in a chamber called a cloaca before leaving the body. Solid waste also collects in the cloaca. Unlike the watery urine of mammals and fish, the urine of birds and reptiles is white and thick. The urine of land insects is solid.

► More to explore

Digestive System • Kidney

Humans and frogs both have kidneys and a bladder in their urinary systems. Frogs and other amphibians have a cloaca as well.

Uruguay

Uruguay is a small country on the east coast of South America. Uruguay's capital is Montevideo.

Geography

Uruguay is the second smallest country in South America, after Suriname. Uruguay borders Brazil in the north and Argentina in the west. To the southeast is the Atlantic Ocean. To the south is a part of the Atlantic called the Río de la Plata.

Hills and plains cover most of the land. The Uruguay River runs along the border with Argentina. The largest river system in Uruguay is the Río Negro. A dam on this river created the Embalse del Río Negro, the largest lake in the country.

Uruguay has mild winters and warm summers. Rain is heaviest in the autumn.

A gaucho (South American cowboy) herds cattle in central Uruguay.

Plants and Animals

Tall prairie grasses cover most of Uruguay. The country has few forests. Alder, willow, eucalyptus, and poplar trees and aloe plants grow near the rivers.

Some pumas and jaguars live in Uruguay. Other native animals include foxes, deer, wildcats, and large rodents called capybaras. Caimans, which are similar to alligators, live in the Uruguay River. Uruguay's birds include vultures, parakeets, and flamingos.

People

Most Uruguayans have Spanish or Italian ancestors. Mestizos, or people with mixed European and American Indian roots, form a small group. A smaller number of people have African roots. Almost all Uruguayans speak Spanish. Roman Catholicism is the main religion. Most people live in cities. Montevideo is many times larger than Salto, the second-largest city.

Economy

Most Uruguayans work in services, including banking, communications, and tourism. However, agriculture is very important to the economy. Large herds of cattle and sheep live on the grasslands. The animals provide beef, wool, leather, and dairy products. Uruguay sells these products to other countries. Farmers also grow rice, wheat, corn, oranges, and sugarcane. Fishing is another source of food. Uruguay's factories produce fuels, chemicals, beverages, machinery, and other goods.

History

A group of American Indians known as the Charrúa lived in the Uruguay region hundreds of years ago. Spanish explorers arrived in 1516, but they did not settle the land.

Banda Oriental

The Spanish called the area the Banda Oriental del Uruguay. The name means "east bank of the Uruguay River." Bands

of gauchos, or Spanish cowboys, hunted the stray cattle that roamed through the region. But the gauchos did not form permanent settlements.

In 1680 the Portuguese set up a town in the Banda Oriental. The Spanish founded the city of Montevideo in 1726 and attacked the Portuguese. By the late 1770s the Spanish had driven out the Portuguese.

In 1810 Spain's American colonies began fighting for independence. People in the Banda Oriental defeated the Spanish. However, Brazil soon took over the Banda Oriental. After several years of war the Banda Oriental finally won independence in 1828. The new country was called Uruguay.

Independence

Civil war erupted in Uruguay soon after independence and continued for about 70 years. Uruguay became a stable democracy in the early 1900s. In the 1960s a terrorist group called the Tupamaros began trying to overthrow the government.

The military took control of the government in 1973. The military defeated the Tupamaros, but it also ruled very harshly. The military government jailed, tortured, or killed many people who disagreed with it. A democratic government finally replaced the military leaders in 1985.

Utah

Each year on July 24, the U.S. state of Utah celebrates Pioneer

Day. This holiday marks the day in 1847 when a group of Mormons seeking religious freedom entered the Great Salt Lake valley. These settlers worked hard to build their community. Their hard work is reflected in both the state's nickname, the Beehive State, and its motto, "Industry."

Today Mormons make up more than half of Utah's population. The Mormon church still has a strong influence on life in the state. Salt Lake City, the state capital, is home to the world headquarters of the Mormon church.

Geography

Utah is a Western state. It is bordered on the north by Idaho and Wyoming, on the east by Colorado, on the south by Arizona, and on the west by Nevada.

Plateaus cover the southeastern part of the state. This is an area of high mesas, brightly colored canyons, and the Colorado River. Western Utah is a broad, flat area with deserts and some mountain peaks. Located in this region are the Great Salt Lake and the Great Salt Lake Desert.

The northeastern part of the state is part of the Rocky Mountains. The Wasatch and the Uinta mountain ranges are in this region. Utah's climate is dry, with warm summers and cold winters.

People

Utah is one of the nation's most sparsely populated states. In other words, very few people are spread throughout Utah's very large countryside. More than 85 percent of the people are white and of European heritage. Hispanic Americans, the largest minority group, make up about 9 percent of the population.

Economy

Service industries are the largest part of Utah's economy. They include health care, engineering, telemarketing, and computer-related services. Banking and tourism are also important in the state. More than 18 million tourists travel to Utah each year. Among the items manu-

The colorful formations of Bryce Canyon National Park attract many visitors to Utah.

factured in Utah are transportation equipment, metals, and processed foods.

Much of Utah's farm income comes from cattle and hogs. Utah's primary crop is hay.

History

Navajo, Ute, Shoshone, and Paiute Indians lived in the Utah region before white settlers arrived. Mexico claimed the Utah area in 1821. Around this time adventurers known as mountain men arrived in the region to take part in the fur trade. Trappers set up trading posts in the area in the 1820s and 1830s. After a war with Mexico, the United States gained control of Utah in 1848.

The first group of Mormons entered Utah in July 1847. In 1849 the colonists formed the State of Deseret, with Brigham Young as the first governor. A year later the United States created Utah Territory.

The Mormons applied for statehood six times between 1849 and 1887. The fed-

eral government, however, would not allow Utah to become a state. The issue preventing statehood was the Mormon custom of polygamy (one husband having several wives). In 1890 the Mormon leadership banned polygamy, and in 1896 Utah became the nation's 45th state.

During World War II Utah's mining industry increased to meet war needs. In the 1960s the state became a center for defense industries, both for research and for manufacturing.

In the 1990s the population in Utah increased by almost 30 percent. It continued that growth in the following decade, adding more than 20 percent to its population by 2008. In 2002 Salt Lake City hosted the Winter Olympic games.

Ute

The Ute are Native Americans of Colorado and Utah. Their traditional homeland also included parts of New Mexico. The U.S. state of Utah was named after the tribe.

The Ute built cone-shaped houses made from poles covered with brush or grass. The lands of the Ute were mostly very dry. The only foods available there were roots, seeds, lizards, insects, rodents, and some other small animals. The Ute traveled to the Rocky Mountains to hunt larger animals and to fish. The Ute got horses beginning in the 1600s. After that they sometimes rode to the Great Plains to hunt bison (buffalo).

Spanish traders began arriving in Ute territory in the 1500s. The Ute traded with the Spanish. They also sometimes fought with them. In the 1840s U.S. settlers began to arrive in the Ute lands. By the end of the 1870s the U.S. government had forced the Ute to give up their territory. The tribe moved onto reservations in Colorado and Utah. At

The Ute often carved pictures on rocks. These carvings are known as petroglyphs.

the end of the 20th century there were more than 7,000 Ute living in the United States.

Utopia

A utopia is an ideal, or perfect, place. The word first appeared in a book written by Sir Thomas More in the 1500s. More came up with “utopia” by combining Greek words meaning “no place.” Some people have thought that though no ideal community exists, people can create one by working together.

In More’s book, Utopia is an imaginary kingdom that is free from all cares, anxieties, and miseries. Everyone lives in a pleasant home surrounded by a garden.

More’s *Utopia* was not the first book of its kind, and it was not the last. The ancient Greeks wrote about utopias more than 2,000 years ago. Utopian books were especially common in the 1800s, when new scientific ideas made people think about a better future. Utopias became a common theme in science fiction.

People have tried many times to establish utopian communities. In North America alone, more than 130 utopian settlements were started between 1663 and 1858. Most failed.

Uzbekistan

Uzbekistan is a country in central Asia. The capital is Tashkent.

Uzbekistan shares borders with Kazakhstan, Kyrgyzstan, Tajikistan, Afghanistan, and Turkmenistan. The only mountains are in the far eastern part of the country. The Aral Sea is in the northwest. Uzbekistan has a dry climate with hot summers and cool winters.

Uzbekistan has few forests. Grasses grow in much of the country. Rodents, foxes, wolves, and gazelles live in the west. Boars, deer, bears, wolves, goats, and lynx live in the mountains.

About three fourths of the people are Uzbeks. There are also small groups of Russians, Tajiks, and Kazaks. Islam is the main religion.

Many of Uzbekistan's people work in agriculture. Uzbekistan is one of the largest cotton growers in the world.

Ichan-Kala, or Royal Court, is a historic area of Khiva, Uzbekistan. It has many ancient buildings.

Other crops include wheat, vegetables, and grapes. Farmers also raise cattle, sheep, and goats. The land provides natural gas, oil, gold, copper, and other minerals.

In ancient times a trade route called the Silk Road ran through the area. In the 700s Arabs brought in the religion of Islam. Uzbeks came from the north in the early 1500s.

The Uzbeks ruled until the 1800s, when Russians took control. In 1924 the Soviet Union made Uzbekistan one of its republics, or states. Uzbekistan gained independence in 1991.

Vaccine

Vaccines are substances that prevent the spread of disease. Giving people vaccines can save millions of lives. For example, smallpox killed some 2 million people in 1967. By 1979 the disease had disappeared. This change resulted from a worldwide program of vaccination.

How Vaccines Work

Many diseases are caused by tiny germs called bacteria or viruses. When people are vaccinated against a disease, they are purposely given the bacteria or virus that causes the disease. They can receive the vaccine in a shot, by mouth, or by a nose spray.

The bacteria or virus in a vaccine is dead or weakened. It causes little if any sickness in the person who receives it.

Instead it causes the body's immune system to make proteins called antibodies, which fight disease. If the same bacteria or virus enters the body later on, the immune system will know how to fight it off.

History

An English doctor named Edward Jenner created the first vaccine in 1796. He saw that people who got the mild disease called cowpox rarely got smallpox, which is more serious. He did experiments to find out why. He scratched material from a cowpox sore into the skin of a healthy boy. The boy got cowpox. Then Jenner scratched material from a smallpox sore into the boy's arm.

A child gets a shot containing a vaccine to protect her against disease.

The boy stayed healthy. The cowpox material was a vaccine against smallpox.

The French scientist Louis Pasteur was another important researcher. In the 1880s he developed a vaccine against rabies. He used a weakened form of the rabies virus to protect against a full attack by the same virus.

Since Pasteur's time, scientists have produced vaccines against many diseases. In the middle of the 1900s Jonas Salk created a vaccine that almost wiped out polio. Vaccines have also been developed for mumps, measles, cholera, plague, tuberculosis, influenza, and hepatitis.

Vacuum

A vacuum is a space with nothing in it—not even air. On Earth there is no such thing as a total vacuum because it is impossible to remove all the air from a

space. But partial vacuums are common. A partial vacuum is a space with almost no air inside.

Vacuums do not exist naturally on Earth. Air surrounds everything on Earth, and it extends for miles above Earth. All of the air above Earth is pushing down all the time. This is known as air pressure. Because of the pressure, air will try to fill any space. In outer space, however, there is no air, so all of outer space is a giant vacuum. That is why astronauts must wear space suits. The suits hold in air at the pressure that humans are used to on Earth. Otherwise their bodies would not function.

A partial vacuum can be made on Earth by removing all solids and liquids and then pumping air out of a container or some other enclosed space. Vacuums have many uses. A vacuum cleaner picks up dirt by sucking air into a vacuum. A medicine dropper creates a vacuum to suck liquid into a tube. A vacuum bottle, or Thermos, is a container with a double wall. A vacuum between the walls stops heat from flowing to or from the outside air. This helps keep the liquid inside cold or warm. Vacuums are

Vacuum packing helps keep foods fresh.

useful in industry, too. For example, food companies use vacuum packaging to help keep food from spoiling.

Vaduz

Vaduz is the capital of Liechtenstein, a country in central Europe. The town lies in the Rhine River valley. It is Liechtenstein's cultural center. The castle of the ruling prince of Liechtenstein overlooks the town.

Tourism is important to the economy of Vaduz. Small factories in the town make high-technology equipment and other products.

Vaduz dates back to at least the 1300s. The town was destroyed in 1499 in a war between Switzerland and the Holy Roman Empire. Vaduz was rebuilt in the early 1500s. It became a state within the Holy Roman Empire.

In 1719 Vaduz was combined with a state called Schellenberg to form Liechtenstein. The Holy Roman Empire existed until 1806. Then Liechtenstein

Valentine's Day

Valentine's Day is a holiday that people celebrate on February 14. It is also called Saint Valentine's Day. On Valentine's Day people greet loved ones, close friends, family members, and school classmates by sending them cards called valentines. People also give candy, flowers, and other gifts to loved ones. Valentine's Day gifts often come packed in a red, heart-shaped box.

People have celebrated Valentine's Day with thoughts of love since at least the 1300s. According to an old European legend, February 14 is the day when birds pair off each year to start their new families. February 14 is called Valentine's Day because the Roman Catholic church honors two saints named Valentine on that day. Both Saint Valentines

were ancient Romans of the AD 200s who died for their Christian faith.

Groups of young men and women once celebrated Valentine's Day by picking up valentines from a box. The person whose valentine was picked up would become the picker's "valentine" for a year.

Valhalla

In the tales of the Vikings and other early people of Scandinavia, Valhalla was a heaven for warriors. Scandinavia is a region of northern Europe. Its tales are known as Norse mythology.

According to the tales, Valhalla was a vast banquet hall. It had at least 540 doors and a roof made of shields. The powerful Norse god Odin ruled over Valhalla. He allowed only warriors who had died bravely to go there.

Female spirits called Valkyries watched over battlefields. They brought dead heroes to Valhalla. The warriors of Valhalla ate the flesh of a boar (pig) that was butchered every day and then magically came back to life.

It was said that the dead warriors would enjoy Valhalla until the end of the world. Then they would rise again to fight against evil giants and demons in a final battle called Ragnarök.

Valley

A valley is a long depression, or ditch, in Earth's surface. It usually lies between ranges of hills or mountains. Most valleys are formed by rivers that erode, or wear down, soil and rocks. This process takes thousands or millions of years.

River Valleys

Like other landforms, river valleys are always changing. Rivers continually wear away the land through which they flow, gradually making the valleys deeper. At the same time, other forces loosen material on the valley walls. These forces include rain, frost, and wind. The eroded material from the valley walls falls into the river and is carried away.

Valleys are usually narrow when they are first formed. Over time, however, most valleys become wider as the walls are worn away. One valley might grow wider than another because the river flows through a softer type of rock that erodes more easily. The force of the river's flow also affects how a valley changes over the years.

Canyons are very narrow, deep river valleys cut through hard rock. They have steep sides that run almost straight up and down. Canyons can be several thousand feet deep. Smaller valleys of this kind are called gorges. Some canyons are remarkable landforms. The Grand Canyon, in the U.S. state of Arizona, is 0.1 to 18 miles (0.2 to 29 kilometers) wide and more than a mile (1.6 kilometers) deep in some places. It was carved by the Colorado River.

Glacial and Rift Valleys

Not all valleys are formed by rivers. Some valleys are formed by huge, slowly moving bodies of ice called glaciers. Thousands of years ago glaciers covered large parts of Earth's surface. As the glaciers moved along, they scraped the land and carried away giant boulders and huge amounts of soil. They left valleys behind.

Other valleys are formed by movements of the huge plates, or pieces of land, that make up Earth's surface. These are called rift valleys. Rift valleys are formed when the edge of one plate

slides downward under the edge of another plate.

Van Buren, Martin

Martin Van Buren was the eighth president of the United States. He helped to found the Democratic Party.

Early Life

Martin Van Buren was born on December 5, 1782, in Kinderhook, New York. He was the son of Abraham Van Buren, a farmer and tavern keeper, and Maria Hoes Van Alen. Both of his parents had Dutch roots.

After studying with a village lawyer, Van Buren started a law practice in 1803. In 1807 he married Hannah Hoes. They had four sons. Van Buren's wife died in 1819. He never remarried.

A river flows through the valley that it carved out over thousands of years.

Martin Van Buren was the eighth president of the United States.

Van Buren was a member of the Democratic-Republican Party, started by President Thomas Jefferson. In the mid-1820s that party split up. Van Buren and followers of Andrew Jackson formed a new political party—the Democratic Party.

In 1828 Van Buren won election as governor of New York. After three months he resigned to become secretary of state under President Jackson.

After Jackson was reelected in 1832, Van Buren became vice president. In 1836 the Democrats chose Van Buren to run for president. Van Buren defeated his opponents in the Whig Party.

Political Career

Van Buren was a successful lawyer, but politics became his main interest. From 1812 to 1820 Van Buren served in the New York Senate. He also served as state attorney general. In 1821 he entered the U.S. Senate.

Presidency

Soon after Van Buren took office, a financial crisis struck the nation. Many banks and businesses failed. The president offered no help. He asked Congress to set up a treasury to protect the government's money.

TIMELINE

Van Buren is born in Kinderhook, New York.

December 5, 1782

Van Buren enters the U.S. Senate.

1821

Van Buren is elected vice president under Andrew Jackson.

1832

Van Buren is elected president.

1836

Van Buren stops a dispute over Maine's border.

1839

Van Buren loses reelection to William Henry Harrison.

1840

Van Buren dies in Kinderhook.

July 24, 1862

Van Buren lost more popularity over a long and costly war with the Seminole people in Florida. He also faced widespread anger over his failure to annex, or take over, the Republic of Texas. However, in 1839 Van Buren successfully stopped a dispute between Maine and New Brunswick, Canada, over Maine's northeastern border.

Later Years

William Henry Harrison defeated Van Buren in the presidential election of 1840. In 1848 Van Buren ran for president as a member of the Free Soil Party, but he received few votes.

Van Buren then traveled in Europe before retiring to his estate in Kinderhook. He died there on July 24, 1862.

Van Gogh, Vincent

During his lifetime the Dutch artist Vincent van Gogh sold only one painting. By the end of the 20th century, however, his paintings regularly sold for millions of dollars. He is well known for his vivid and colorful self-portraits, paintings of flowers, and landscapes such as *Starry Night*. Van Gogh worked with great speed and passion, using coarse brushstrokes. He greatly influenced the style of art called expressionism, which shows the emotions that objects and events stir up in the artist.

Vincent Willem van Gogh was born on March 30, 1853, in Zundert, The Netherlands. He trained to be an art dealer. Later he turned to religious studies and did missionary work in Belgium.

Van Gogh did not begin his career as an artist until 1880. In the following 10 years he produced more than 800 oil paintings and 700 drawings. He moved around frequently, painting and studying art in The Netherlands and Belgium. During a stay in Paris, France, he met many modern artists, and his style became less traditional. In 1888 he moved to Arles in southeastern France, where he did some of his best work.

A famous event took place in Arles in 1888. After a quarrel with artist Paul Gauguin, Van Gogh cut off the lower half of his own left ear. Van Gogh spent

Vincent van Gogh painted many pictures of himself. His *Self-Portrait with Straw Hat* was done in about 1887.

much of the rest of his life in and out of mental hospitals. He shot himself on July 27, 1890, and died two days later near Paris.

Vanilla

Cooks use vanilla as a flavoring in ice cream, cakes, cookies, and many other types of food. Vanilla comes from beans that grow on certain types of orchids in warm parts of the world. Madagascar, Indonesia, and China produce large amounts of vanilla.

An orchid is a type of flowering plant. A vanilla orchid has a long climbing stem that attaches itself to a tree trunk or pole. The plant produces large yellowish flowers. The fruits that develop from these flowers are long pods with seeds inside. People call these pods vanilla beans. The pods may grow to be 8 inches (20 centimeters) long. It can take up to nine months for them to be ready for picking.

A vanilla orchid plant will not produce beans unless its flowers are pollinated, or fertilized. Usually people pollinate vanilla plants by hand. They use a wooden stick to move grains of pollen from the male parts of the flowers to the female parts.

A vanilla bean has no taste or smell until it is processed. Beans are processed by drying and storing them until a chemical change called fermentation

Vanilla beans grow in the form of long pods.

takes place. Fermentation creates crystals of a chemical called vanillin. Vanillin is what gives vanilla its taste and smell.

The processed beans are crushed and mixed with alcohol to extract, or take out, the vanillin and other chemicals. The liquid that results is called vanilla extract. It is used for flavoring.

The Aztec of Mexico flavored their chocolate drinks with vanilla for hundreds of years before the Spanish arrived in their lands in the 1500s. The Spanish learned about vanilla from the Aztec, and they later introduced it to other Europeans. Vanilla soon became a popular flavoring for candy and baked goods. But natural vanilla is expensive to produce. Most vanilla today is made from vanillin that is synthesized, or created artificially, in a factory.

Vanuatu

The country of Vanuatu is a chain of islands in the southwestern Pacific Ocean. Its capital is Vila, on Éfaté Island.

Geography

Vanuatu is about 1,100 miles (1,800 kilometers) east of Australia. It lies in Melanesia, the western part of the large region called Oceania. The country includes 13 main islands and about 60 smaller ones. The largest island is Espíritu Santo. Many of the islands have mountains with active volcanoes. The climate is hot and rainy.

Plants and Animals

Thick rain forests grow on the islands. The drier regions have patches of grassland. The islands' birds include pigeons, parrots, honeyeaters, and thrushes. Several types of bats also live on the islands.

People

Most of the people in Vanuatu are Melanesians. There are also small groups

of Europeans and people from the nearby area of Polynesia. Christianity is the main religion. Most of the people live in small villages.

More than 100 languages are spoken in Vanuatu. Most people also speak Bislama, a language based on English. English and French are also commonly spoken.

Economy

Farming, fishing, and raising cattle are the main jobs in Vanuatu. Farmers grow coconuts, yams, taro, and other fruits and vegetables. Vanuatu sells dried coconut meat, beef, cocoa, and wood to other countries. Tourism and banking are also important to the economy.

History

Melanesian peoples have lived on the islands of Vanuatu for more than 3,000 years. Europeans explored the islands in the 1600s and 1700s. The British named the islands the New Hebrides, after the Scottish Hebrides island group. British and French settlers arrived in the 1800s. Beginning in 1887 Great Britain and France shared control of the islands.

The New Hebrides gained independence in 1980. The islands' people renamed the country Vanuatu, which means "Our Land Forever."

Vatican City

Saint Peter's Basilica is one of the largest Catholic churches in the world.

Vatican City is the smallest country in the world. It is the home of the pope, who is the head of the Roman Catholic church. From Vatican City the pope directs the government of the church. Vatican City is also called the Vatican or the Holy See.

Geography

Vatican City sits inside the city of Rome, Italy. Stone walls surround most of Vatican City. Inside the walls are a large church called Saint Peter's Basilica, the Vatican Palace, and other buildings. The Vatican Palace contains the pope's apartments, museums, a library, and the Sistine Chapel. The Sistine Chapel is famous for its ceiling, which has scenes from the Bible that were painted by the artist Michelangelo.

Vatican City also owns many buildings in Rome. In the Alban Hills just south of Rome is Castel Gandolfo, the pope's summer home. In addition, Vatican City

has embassies, called nunciatures, in many capital cities.

People

The pope and hundreds of members of the church's government live and work in Vatican City. Dozens of Swiss Guards, who protect the pope, also live with their families in the city. About 3,000 other people work in Vatican City. Most of those workers live in Rome. Most people speak Italian. The Latin language is used in official documents and in some church services.

Economy

Vatican City's economy is different from the economies of other countries. Roman Catholics around the world give money to their local churches. Vatican City then receives some of that money. The Vatican also sells books, stamps, coins, and souvenirs. Tourists pay to see its museums.

History

Rome became the center of the Roman Catholic church by the 300s. After the 750s the popes controlled much of central Italy. That area was called the Papal States. In 1870 the government of Italy took over the last of the church's lands. In 1929 the Italian government agreed to let Vatican City become an independent country.

Veda

Brahma was a major god of Hinduism. He was often shown holding a number of objects, including the sacred Hindu text called the Rigveda.

The ancient sacred texts of Hinduism are called the Veda, which means “knowledge.” Hindus composed these texts in what is now India over hundreds of years, beginning in about 1500 BC. For a long time they passed down the texts of the Veda by reciting them. Eventually they wrote the texts down. Hindus today still study the Veda.

The earliest parts of the Veda are four collections of hymns (songs and poems) known as the Vedas. The first, the Rigveda, contains more than 1,000 hymns about Hindu gods and rituals. The Yajurveda helped priests follow these rituals. The Samaveda contains verses that priests chanted or sang. The Atharvaveda includes magic spells and

rituals. It differs from the other Vedas because it is based more on everyday religious ideas than on the lives of the gods.

The Veda also includes the Brahmanas, the Aranyakas, and the Upanishads. These texts comment on the earlier Vedas. They explain the importance and deeper meanings of Hindu rituals and beliefs.

Vegetable

Vegetables are the leaves, stems, roots, or other parts of certain plants that people eat. Vegetables usually come from herbaceous plants. Herbaceous plants have stems that are softer than the woody stems of bushes and trees.

Shoppers at a farmers' market choose from a variety of fresh vegetables.

Many vegetables grow aboveground. Lettuce, spinach, brussels sprouts, and cabbage are the leaves of plants. Asparagus spears are stems. Broccoli, cauliflower, and artichokes are flowers.

Other vegetables grow underground. Root vegetables are the roots of plants. These include carrots, beets, turnips, radishes, and sweet potatoes. Tubers are a kind of underground stem. Potatoes are the most commonly eaten tuber. Garlic and onions are plant bulbs, which are underground buds.

Some foods that people call vegetables are really fruits. Cucumbers, squashes, eggplants, and pumpkins are all fruits. They contain seeds, while true vegetables do not.

Vegetables are an important part of a healthy diet. They contain water, vitamins, minerals, and fiber. People eat many fresh vegetables raw. They drink the juice of some raw vegetables, especially carrots. People also eat baked, boiled, fried, steamed, and grilled vegetables. They often add vegetables to soups, stews, and casseroles. Most fresh vegetables spoil quickly, but they can be canned or frozen for later use.

Velázquez, Diego

Diego Velázquez was one of Spain's greatest painters. He is especially famous for his portraits (pictures of people).

Las Meninas is one of the most famous works by Diego Velázquez. It shows a scene in the artist's own studio in the palace of the king of Spain. The king's 5-year-old daughter has been brought in for a visit. Two older girls—the maids of honor—look after her. Velázquez himself stands at left, holding a paintbrush.

Velázquez was born in 1599 in Seville, a city in southern Spain. At the age of about 12 he went to work as an apprentice, or helper, in an artist's studio.

At first Velázquez painted scenes of everyday life. But in 1623 he became court painter to King Philip IV of Spain. A court painter's job was to make paintings of the royal family and the high officials and nobles of the kingdom. As court painter Velázquez lived in Madrid, the capital of Spain.

Velázquez spent the years between 1629 and 1631 in Italy studying Italian art. He returned and became the Spanish court painter once again.

Velázquez had other duties as well. He went to Italy for a second time in 1649 to buy art for the king's collections. While in Rome he painted a famous picture of Pope Innocent X, the head of the Roman Catholic church.

Back in Madrid, Velázquez painted some of his greatest works, including *Las Meninas* (The Maids of Honor). He died on August 6, 1660.

Velociraptor

The name *Velociraptor* means “quick plunderer.” This dinosaur was named for its speed when hunting its prey. It belongs to the group of dinosaurs called dromaeosaurs, or “terrible-clawed lizards.” They are also known as raptors.

When and Where *Velociraptor* Lived

Velociraptor lived about 99 to 65 million years ago. Fossil remains of *Velociraptor* have been found in Asia. In Mongolia scientists uncovered the skeleton of a

Velociraptor locked in a battle with a dinosaur called *Protoceratops*. This find presents a picture of the violent struggle for survival during prehistoric times.

Physical Features

Velociraptor was a small dinosaur that ran on its two back legs. It reached a length of about 6 feet (2 meters) and weighed up to 100 pounds (45 kilograms). The most striking feature of *Velociraptor* was the curved claw on each foot. *Velociraptor* had long, muscular legs and arms. The head of *Velociraptor* was low and long, and its snout was flat. Its jaws contained razor-sharp teeth useful for ripping apart flesh.

Behavior

Velociraptor was a meat-eating dinosaur that often preyed upon smaller animals. Scientists believe that it pounced on its victims from a hiding spot. It then chased them down when they tried to escape. *Velociraptor* hunted in packs to bring down larger dinosaurs as well. It also may have been a scavenger, meaning that it fed upon dead animals.

Dinosaur

Velociraptor was not much taller than a modern chicken.

Venezuela

The water of Angel Falls drops 3,212 feet (979 meters), making it the highest waterfall in the world.

Venezuela is a country on the northern coast of South America. In the 1800s Venezuela led the fight for South America's independence from Spain. The capital of Venezuela is Caracas.

Geography

Venezuela shares borders with Colombia, Brazil, and Guyana. Venezuela claims that western Guyana belongs to it, but Guyana does not agree. The Caribbean Sea lies north of Venezuela, and the Atlantic Ocean lies to the northeast. Some islands in the Caribbean belong to Venezuela.

Both high mountains and low plains run along Venezuela's coast. The Andes Mountains rise in the northwest. Also in the northwest is Lake Maracaibo, the largest lake in South America. The Orinoco River flows through the center of the country. Along the Orinoco is the Llanos, a huge area of grasslands. In the southeast there are rugged highlands and the world's highest waterfall, Angel Falls. Venezuela has a warm climate with rainy and dry seasons.

Plants and Animals

Tropical rain forests grow in parts of Venezuela. Grasslands cover about half of the country. Mangrove trees grow in swampy areas of the coast. The highest parts of the Andes have only shrubs and lichens.

Venezuela's forests are home to jaguars, tapirs, armadillos, deer, monkeys, and

Venezuela is home to many different kinds of birds, including flamingos.

snakes. Turtles, piranhas, and crocodiles live in the country's waters.

People

Most Venezuelans are mestizos, or people with both American Indian and European roots. There are also large groups of whites and blacks. American Indians make up only a small part of the population. Spanish is the main language, but Indian groups speak more than 25 other languages. Most people are Roman Catholics. Almost 90 percent of the people live in cities and towns. Few people live in the area south of the Orinoco River.

Economy

Venezuela's economy is based mainly on the production of oil and natural gas. The country is one of the top oil producers in the world. Venezuela's other minerals include iron ore, coal, bauxite (which is used to make aluminum), gold, and diamonds. Factories produce iron and steel, aluminum, clothing, processed foods, and chemicals. Banking, tourism, and other services are also important to the economy.

Agriculture is a small part of the economy. The main crops include sugarcane, corn, bananas, sorghum, and rice. Cattle raising is common on the grasslands.

History

Arawak and Carib Indians lived in what is now Venezuela when Christopher Columbus reached the coast in 1498. Later European explorers saw houses on stilts that the Indians had built. This reminded them of Venice, the Italian city built on islands. They named the land Venezuela, which means "Little Venice."

The Spanish began settling the area in the 1520s. Spain ruled Venezuela for the next three centuries. In 1811 Venezuelans declared their independence. The Spanish crushed the Venezuelan revolution, but the Venezuelan leader Simón Bolívar continued the fight. His forces defeated the Spanish in 1821.

Venezuela was a part of a country called Gran Colombia until 1829. In 1830 it became an independent country. Military leaders ruled Venezuela for many years. In 1958 Venezuela's navy and air force forced out the military ruler. After that date Venezuela elected presidents to lead the country.

In 2002 army leaders arrested Venezuela's president. However, the president returned to power only two days later.

Venice

Population
(2007 estimate)
268,930

The city of Venice is a major center of culture and tourism in Italy, a country in southeastern Europe. It is famous for its beautiful canals, palaces, and art. The city is built on more than 100 small islands. They lie in a body of water called a lagoon at the edge of the Adriatic Sea.

Cityscape

Canals and about 400 bridges link the islands of Venice. People travel through the city by boat or by walking. A type of long, flat-bottomed boat called a gondola is a traditional symbol of Venice. The Grand Canal is like the city's main street.

The Piazza San Marco is the main square in Venice. A magnificent church called the San Marco Basilica is located there. It is famous for its golden domes and the golden tile decorations inside. Also on the square is the Doges' Palace, which was once home to the city's rulers.

Economy

The economy of Venice is based mainly on tourism. In addition, craftspeople from the city sell their famous glass and

lace products to tourists. Trade, ship-building, fishing, and manufacturing also bring money to Venice.

History

People settled the islands of Venice in the 500s. They moved there to escape invaders on the Italian mainland.

A series of dukes, called doges, ruled Venice from the 700s until 1797. It developed into an independent power called a city-state. Venice controlled important trade routes and grew wealthy from sea trade. In the 1200s it began taking over other territories in the region. Venice achieved its greatest power and wealth in the 1400s.

Venice began to decline in the 1500s. It gradually lost the lands of its empire in wars with other powers. Austria took control of Venice in 1797. The city has been part of Italy since 1866.

In modern times air pollution and regular flooding have damaged Venice's great buildings. Also, the islands have

Boats called gondolas gather for a special event on the Grand Canal of Venice, Italy.

been sinking into the lagoon at an alarming rate. In the 20th century the city began projects to try to control these problems.

Venus

Venus is one of the planets that orbit, or travel around, the sun in the solar system. Venus is the brightest planet in the sky when viewed from Earth. It is Earth's nearest neighbor, coming closer to Earth than any other planet. Venus is the second planet from the sun. Its distance from the sun averages about 67 million miles (108 million kilometers). It is the hottest planet in the solar system.

A view of Venus taken by the Magellan spacecraft shows the planet's highest mountain range. It appears as a bright spot near the center of the photograph.

Physical Features

Venus is about the same size and weight as Earth. Its diameter, or distance through its center, is about 7,500 miles (12,100 kilometers). It is solid and rocky. Scientists believe that Venus also has layers like Earth's. These layers consist of a metal core, a thick rocky middle, and a crust.

In the past lava from erupting volcanoes shaped the surface of Venus. Most of the landscape is gently rolling plains. Venus also has tall mountains.

The atmosphere, or layer of gases, surrounding Venus is thick and heavy. Also, thick clouds always cover the planet. The gases and clouds trap heat. The temperature near Venus' surface is about 867° F (464° C). Its surface is hot enough to melt lead.

Orbit and Spin

Like all planets, Venus has two types of motion: orbit and spin. The orbit is the path it takes as it travels around the sun. Venus orbits the sun in a nearly perfect circle. Venus takes 225 Earth days to complete one orbit. In other words, one year on Venus lasts 225 Earth days.

Venus also spins, or rotates about its center. A planet's orbit and spin combine in a complex way to determine the length of a day on that planet. For most planets a day is almost equal to the time it takes to complete one rotation. Venus is unusual in that the length of its day is very different than the time it takes to complete one rotation. The planet takes 243 Earth days to complete one rota-

tion, but a day on Venus lasts only about 117 Earth days. A day on a planet is the time it takes for the sun to appear straight overhead, to set, and then to rise straight overhead again.

Observation and Exploration

People have observed Venus from Earth since ancient times. In addition, more than 20 unmanned spacecraft have visited the planet. The U.S. Mariner 2 spacecraft passed by Venus in 1962. It was the first spacecraft to fly near another planet. In 1970 the Soviet Union's Venera 7 landed on Venus. It was the first spacecraft to successfully land on another planet. In the 1990s the U.S. Magellan spacecraft mapped Venus' surface in great detail. The European Space Agency sent a craft to study Venus' atmosphere in 2005.

Venus's-flytrap

The Venus's-flytrap is a plant that traps and eats insects. It belongs to a group of carnivorous, or meat-eating, plants. This group also includes sundews and pitcher plants. The scientific name of the Venus's-flytrap is *Dionaea muscipula*.

In the wild the Venus's-flytrap grows only in parts of North and South Caro-

The Venus's-flytrap has pairs of leaves that look like toothy jaws.

lina, in the United States. It grows best in soil that is damp.

The Venus's-flytrap grows from a bulb-like root. It reaches heights of between 8 and 12 inches (20 to 30 centimeters) and produces small, white flowers. The leaves of the plant grow in rounded halves. The halves are hinged together on one side like jaws. Each half has long spikes along its edge and three hairs on top that are sensitive to touch. The leaf oozes a sticky substance that attracts flies and other insects.

When an insect crawls between the two halves of a leaf, the hairs detect its presence. In less than a second, the leaf snaps shut and the long spikes lock together. The leaf then releases digestive juices that break down the insect into nutrients. The leaf absorbs the nutrients and transports them to all parts of the plant. This process takes about 10 days. Then the leaf reopens.

Vermont

The U.S. state of Vermont is nicknamed the Green Mountain State. The nickname comes from the state's central geographical feature, the Green Mountains. Vermont's name comes from the French words for "green" and "mountain"—*vert* and *mont*. The state capital is Montpelier.

Geography

Vermont is located in the northeastern corner of the United States in the region known as New England. The state is bordered on the north by the Canadian province of Quebec and on the south by Massachusetts. To the west is New York, which is separated from northwestern Vermont by Lake Champlain. The Connecticut River forms Vermont's border with New Hampshire on the east.

The town of Stowe is a popular destination for tourists to Vermont.

The Green Mountains run down the center of the state and cover most of the land. These heavily forested highlands are part of the Appalachian Mountain range. Winters in Vermont are cold, and summer days are rarely hot. Snowfall can be very heavy, especially in the mountains.

People

The earliest European settlers were Protestants of English heritage. The state remains populated largely by offspring of the original settlers and of later immigrants from Europe and Canada. Vermont's minority groups are very small. African Americans, Asians, Hispanics, and Native Americans together make up only about 3 percent of the population.

Economy

The greatest portion of Vermont's economic earnings come from businesses and organizations that provide services. Some examples of major business ser-

vices are banking and finance, commercial sales, and real estate. Tourism is also an important service industry in Vermont.

Vermont's manufacturers make electronic equipment, metal products, and foodstuffs. Semiconductor chips, a common part in most electronic systems, are produced in Vermont. IBM, one of the world's largest electronics companies, has a manufacturing plant near Burlington. IBM is Vermont's leading employer. Dairying has always been Vermont's main agricultural activity, and the state is a major producer of milk. The ice-cream maker Ben and Jerry's is based in Vermont. Vermont is a national leader in the production of maple syrup and maple sugar.

History

Abnaki Indians lived in the Vermont region before the arrival of Europeans. No permanent European settlement was made until the French built a fort on Isle La Motte in Lake Champlain in 1666. Both the Dutch and the British established settlements in the area in the 1700s. In 1763 the British took control of the area.

During the colonial era both New Hampshire and New York claimed parts of the Vermont region. In 1770 Ethan Allen organized fighters known as the Green Mountain Boys to drive the New Yorkers from the region. In 1777 Vermont declared itself independent of both New Hampshire and New York. Vermont remained independent until it joined the Union in 1791.

Many people ski in the mountains of Vermont.

Vermont remained loyal to the Union during the American Civil War (1861–65). It was the site of the only Civil War action north of Pennsylvania. In 1864 soldiers from the Confederacy raided the town of Saint Albans and robbed its banks.

The farming community suffered as the number of Vermont's farms began to decline after the Civil War. Farms continued to drop in the 1900s. In the 1930s the first ski runs were built in the state. By the 1960s Vermont had a successful winter tourist industry. In the early 21st century hotels, restaurants, and recreational sites were important parts of Vermont's economy.

Verne, Jules

An illustration from Jules Verne's *Twenty Thousand Leagues Under the Sea* shows Captain Nemo looking at an octopus through a window in his submarine, the *Nautilus*.

The French author Jules Verne is known as one of the first science fiction writers. He wrote more than 50 novels and many short stories.

Verne was born on February 8, 1828, in Nantes, France. He studied law and worked for a while as a stockbroker. But he always considered himself to be a writer. His first play was produced in 1850. His first successful adventure story was *Five Weeks in a Balloon*, which was published in 1863.

Verne studied science to make his stories as believable as possible. He knew so much that he was able to imagine many developments that would soon take place in real life. In his novels and stories

he predicted wonders such as television, airplanes, space travel, and modern submarines.

Verne's most famous adventure novels are probably *Twenty Thousand Leagues Under the Sea* (1870) and *Around the World in Eighty Days* (1873). *Twenty Thousand Leagues Under the Sea* is the story of Captain Nemo, a mysterious wanderer who commands a marvelous submarine. *Around the World in Eighty Days* is the story of Phileas Fogg, an English gentleman who makes a very speedy (for the 1870s) trip to win a bet.

Verne died in Amiens, France, on March 24, 1905. His works were translated into many languages and continue to be popular. Several successful movies were made from his works.

Verrazzano, Giovanni da

Giovanni da Verrazzano was an Italian explorer who worked for the French government. He explored the Atlantic coast of what is now the United States. He was the first European to see New York Bay.

Verrazzano was born near Florence, Italy. As an adult he moved to France. Then he went to sea on French ships. He made several trips to the Middle East.

In 1524 Verrazzano commanded a ship that went across the Atlantic Ocean. Like many other European explorers, he was looking for something that did not exist—a short route to Asia. He landed at Cape Fear, which is now in North Carolina. He first went south but soon turned north because he did not want to meet the Spanish.

Verrazzano soon found New York Bay. He sailed by a narrow waterway that separated two parts of New York that are now called Long Island and Staten Island. Verrazzano then explored what is now Rhode Island and met Native Americans. He continued all the way to Newfoundland before returning home. He claimed everything he saw for France. The French later made colonies in the northern part of the lands he claimed.

Verrazzano later made two more trips to the Americas. In 1527 he commanded ships that went to South America. He returned with a cargo of valuable wood. In 1528 Verrazzano made a trip to Florida, the Bahamas, and finally the islands of the Caribbean Sea. His trip ended when he was captured and killed by the Carib people.

The Verrazano-Narrows Bridge, which spans part of New York Bay, was named for the explorer. The bridge uses a different spelling of Verrazzano's name.

Versailles

Versailles is a city in France. It is about 14 miles (22 kilometers) southwest of Paris. Versailles is famous for a palace built in the 1600s under the guidance of King Louis XIV. The Palace of Versailles was one of the most costly and extravagant buildings in the world. French kings lived there for more than 100 years.

Versailles was not even a town when King Louis XIII built a hunting lodge there in the 1630s. The expansion of the lodge into the palace began in the 1660s. Construction went on through the next century. When the building was completed, about 5,000 people lived there. Other buildings on the palace grounds include the Grand Trianon and the Petit (Small) Trianon. They were built as private residences for the royal family and special guests.

The town of Versailles grew around the palace. It was founded in 1671. Many of the first residents were people who had

The Palace of Versailles is known for its extensive gardens as well as its grand buildings.

come to work on the palace. When Louis XIV died in 1715, after 72 years as king, the town of Versailles had a population of 30,000.

The Palace of Versailles was used as the royal residence until the French Revolution started in 1789. After the revolution, the palace was nearly destroyed. In 1837 King Louis-Philippe restored it and turned it into a museum.

Vertebrate

A vertebrate is an animal with a backbone. (An invertebrate is an animal without a backbone.) Fishes, amphibians, reptiles, birds, and mammals, including humans, are all vertebrates.

Vertebrates share some basic characteristics. A hollow backbone and the cranium, or skull, protect the spinal cord and brain of most vertebrates. All vertebrates reproduce by mating between males and females.

Fish are the oldest known vertebrates. Most fish have a bony skeleton. However, sharks and rays have a skeleton made of cartilage, a strong and flexible tissue. Fish gradually evolved, or changed, into land animals.

Mammals are the most complex kind of vertebrate. They feed their babies with milk from the mother, they develop inside their mother's body, and they have hair. Their highly developed brains

make them more intelligent than other groups of animals.

Vespucci, Amerigo

The name of America appeared for the first time on a map made in 1507. The map showed the lands that Amerigo Vespucci had visited in the New World.

Amerigo Vespucci was an explorer from Europe. The Americas are named for him though he was not the first European to visit North or South America. He crossed the Atlantic Ocean several years after Christopher Columbus made his first voyage of discovery.

Vespucci was born in 1454 in Florence, Italy. In 1491 he went to live in Spain. There he worked for a company that helped people prepare ships for voyages. Through his work he met Columbus. He helped to gather supplies for the second and third voyages of Columbus.

In about 1499 Vespucci himself set sail on a Spanish ship. He was the

Did You Know?

Vertebrates with two pairs of limbs are called tetrapods. Limbs include legs, arms, wings, and flippers.

navigator, or the person who found the way. He explored the northeastern coast of South America and then returned to Spain.

In 1501 Vespucci sailed again, this time on a Portuguese ship. He explored the southeastern coast of South America.

When he got back to Europe, Vespucci wrote about his travels. Unlike Columbus, he did not think he had been to Asia. Instead he described the places he had seen as a “New World.”

A German mapmaker named Martin Waldseemüller read Vespucci’s writings. In 1507 Waldseemüller made a world map and labeled South America as “America.” (Vespucci’s first name was also spelled Americus.) Later mapmakers used “America” for North America and Central America as well, even though Vespucci had never been to either place.

After he stopped traveling Vespucci went to work for the Spanish government. He helped to prepare the official map of

newly discovered lands and of the routes to them. He died in 1512 in Spain.

Vesuvius, Mount

Mount Vesuvius is an active volcano in southern Italy. It is famous for an eruption that happened in AD 79. Thousands of people died when lava, ashes, and mud buried the cities of Pompeii, Herculaneum, and Stabiae. The cities were forgotten until archaeologists began digging up their ruins in the 1700s.

Mount Vesuvius towers over the ruins of the ancient city of Pompeii, in southern Italy. An eruption of Vesuvius buried Pompeii in AD 79, but workers have uncovered much of the city.

Mount Vesuvius stands about 4,200 feet (1,280 meters) high, but its height changes after each major eruption. A high ridge known as Mount Somma partly surrounds the main cone of Vesuvius. The area between the ridge and the cone is known as Valle del Gigante (Giant's Valley). At the top of the cone is a large crater. It is about 1,000 feet (300 meters) deep and 2,000 feet (600 meters) across.

Scientists believe that Mount Vesuvius was formed about 200,000 years ago. Vesuvius was inactive for hundreds of years before the disaster of AD 79. Since then the volcano has erupted many times. An eruption in 1631 killed about 3,000 people. The last major eruption occurred in 1944.

Veterans Day

Every year on November 11, people in the United States celebrate Veterans Day. The holiday honors veterans, or people who served in the U.S. military. The day especially honors those veterans who died while fighting in a war.

To celebrate Veterans Day, some cities and towns have parades. Veterans from the area may march in the parades. Sometimes people visit cemeteries on Veterans Day. People may put flowers or flags on the graves of veterans to honor them.

A veteran of World War II (1939–45) wears his uniform and medals at a U.S. Veterans Day ceremony.

Before it got the name of Veterans Day, November 11 was called Armistice Day. November 11, 1918, was the day of the armistice (agreement to stop fighting) that ended World War I.

The United States celebrated the first Armistice Day in 1919. Armistice Day became an official holiday in 1938. U.S. forces later fought in World War II (1939–45) and the Korean War (1950–53). In 1954 Armistice Day was renamed Veterans Day to honor veterans of all wars.

People in Australia, Canada, France, and the United Kingdom also honor veterans on a day in November. Canada and

Veterinary Medicine

Veterinarians, or veterinary surgeons, are animal doctors. A veterinarian's job is to keep animals healthy and to treat them when they get sick. This branch of medicine is called veterinary medicine, or veterinary science.

People go to school to become veterinarians. They must earn a degree called a doctor of veterinary medicine. This takes at least four years. Veterinarians can specialize in different areas. For example, some only take care of pets.

Before they can treat animals, veterinarians must pass a state test. They then

Veterinarians at zoos care for a wide range of animals.

decide where they want to work. Many veterinarians work in hospitals or clinics. Others start their own business, or practice.

Many people think of veterinarians as pet doctors. But veterinarians are also very important to zoos and farms. Farmers can go out of business if a disease kills many of their animals. Veterinarians try to keep the animals free from disease. They also help the animals breed and give birth. They do the same things for zoo animals. This is especially important since many endangered animals live in zoos.

Not all veterinarians treat animals. Some teach veterinary medicine. Others conduct research. They look for better medicines. In addition, a number of veterinarians try to control animal diseases that can spread to humans.

Pet owners can help keep their pets healthy by taking them to a veterinarian for regular checkups.

Veterinary medicine may have begun as early as 2000 BC in Babylonia (present-

day Iraq) and Egypt. In the Middle Ages (AD 500–1500) veterinary medicine practically disappeared. Then in the 1700s a disease killed herds of cattle in Europe. To prevent this from happening again, colleges of veterinary medicine were created in Europe. Soon they were found all over the world.

Viburnum

Viburnum flowers grow in round clusters, or groups, that sometimes look like snowballs.

Viburnums are shrubs and small trees that are often planted in parks and gardens. Most have showy flowers and colorful fruits.

There are 200 species, or types, of viburnum. Plant scientists place them in the honeysuckle family of plants. They can be found in Europe, Asia, and North America. Viburnums grow in areas that have mild or subtropical weather.

The flowers of viburnums are often white and have a sweet smell. They usually grow in clusters, or groups. These

clusters can be so large that they look like snowballs. Two popular types of viburnum are the Chinese snowball and the Japanese snowball.

Most viburnums have blue-black fruit. Their leaves come in many shapes. A type of viburnum called the black haw has plumlike leaves. The sheepberry has oval leaves.

Viburnums vary in height. The American wayfaring tree grows up to 10 feet (3 meters) tall. The wayfaring tree of Europe reaches a height of 16 feet (5 meters).

Victoria, Queen

Queen Victoria was queen of the United Kingdom from 1837 to 1901. She reigned over her country longer than any other British king or queen before her. Her reign is called the Victorian Age.

Queen Victoria

Early Life

Alexandrina Victoria was born on May 24, 1819, in London, England, the capital of the United Kingdom. Her father was a son of King George III. Her mother was a German princess.

Reign

Victoria became queen in 1837. She was 18 years old. The young queen learned about the British government from Lord Melbourne, the British prime minister (head of government).

In 1840 Victoria married her cousin Prince Albert of Saxe-Coburg-Gotha. They had nine children together. Almost all of them married members of European royal families.

Albert died in 1861. Victoria was never really happy after that. She stopped going to places where people could see her. She spent less and less time in London and more and more time in a castle in Scotland called Balmoral.

Then another prime minister, named Benjamin Disraeli, became Victoria's friend. Disraeli pleased Victoria in 1876 by making the British government a part owner of the Suez Canal. The canal was an important link between Europe and Asia. Disraeli pleased Victoria even more by giving her the title of empress of India in 1876.

Later Years

As the years passed, Victoria kept her popularity. In 1887 the British people had a big celebration called the Golden

Jubilee to honor her 50 years as queen. Ten years later they had another big celebration called the Diamond Jubilee.

On January 22, 1901, Victoria died at age 81 on the Isle of Wight, an island in the English Channel. Her son Edward VII then became king.

George III • United Kingdom

Victoria

Victoria is the second smallest of Australia's six states. Only the island state of Tasmania is smaller. But Victoria is the second largest state in population. Only New South Wales has more people. Victoria's capital is Melbourne.

Geography

Victoria lies in the southeastern corner of Australia. It shares borders with New South Wales on the north and South Australia on the west. The Pacific Ocean lies to the east. The Tasman Sea and the Antarctic Ocean lie to the south. Victo-

ria's area is 87,806 square miles (227,416 square kilometers).

The Murray River runs along most of Victoria's border with New South Wales. Mountains rise in the northeast and in the center of the state. Mount Bogong, at 6,516 feet (1,986 metres), is the highest point. Flat plains lie north, west, and south of the mountains. Sandy deserts are found in the west.

People

About 5 million people live in Victoria. Most people can trace their roots to Great Britain. Some have other European or Asian roots. About one quarter of Victoria's people were born outside Australia. A small number of Aborigines, or native Australians, also live in Victoria.

Melbourne is the largest city in Victoria and the second largest city in Australia.

The unusual rock formations off the coast of Victoria, Australia, are called sea stacks. They were formed over thousands of years by the water washing away at the stone. The process continues, and in 2005 one of the rocks collapsed into the water.

It has a population of more than 3 million. Melbourne is a port, an industrial city, and the cultural center of Victoria. It lies on the southern coast of the state.

Economy

Victoria has one of the strongest economies in Australia. Many people work in manufacturing. Factories produce machines, vehicles, clothing, and paper. Many other people of Victoria work in services—for example, banking, communications, and tourism.

The state's farmers grow wheat, broccoli, brussels sprouts, celery, cauliflower, lettuce, and potatoes. Sheep and cattle ranchers produce wool and beef products. Victoria's mineral resources include coal, oil, and natural gas.

History

Aborigines first settled in what is now Victoria at least 40,000 years ago. In 1770 the British explorer James Cook became the first European to visit the region. At that time between 15,000 and 20,000 Aborigines lived there.

In the 1830s Europeans started to settle in the area. The land was then a part of the British colony of New South Wales. The Europeans fought wars with the Aborigines. By 1850 only about 3,500 Aborigines were left in the region.

By 1850 Victoria had about 76,000 people, mainly farmers and sheep herders. Victoria became a separate colony of Great Britain in 1851. The discovery of gold in that year soon brought many

more people. More than 200,000 came from Britain, and another 25,000 came from China.

In 1855 Victoria set up its own government. In 1901 Australia gained independence from Britain. Victoria then became a state of Australia.

Video Recording

Video recording is a way of storing television programs and other moving images along with sound. Video recording is used to record TV programs for later broadcast. Video recording also

gives viewers the ability to save a TV program and watch it whenever they want to.

Thousands of movies are available in the form of video recordings, too. They can be viewed on a TV set or a computer screen. And many people make their own movies using portable video cameras called camcorders.

How Video Recording Works

Video cameras such as TV cameras create electric signals that represent pictures (video) and sound (audio). A TV set receives these signals and uses them to reproduce the pictures and sound that the camera recorded.

Home video-recording devices allow people to record video and audio signals. One such device is the videocassette

Tourists use camcorders to record interesting animals, people, or events that they observe during their travels.

recorder, or VCR. It changes the signals into patterns of magnetic particles on a plastic tape. The tape is stored in a case called a videocassette. VCRs can also play recorded videocassettes. They read the magnetic patterns on the tape and re-create the recorded electric signals.

Digital video-recording devices store video and audio signals as a number code. DVD recorders store the number code on plastic discs called digital video-discs, or DVDs. The code is recorded on the disc as a series of tiny pits, or holes, arranged along narrow tracks. A DVD player uses a laser to read the code and turn it back into pictures and sound. A digital video recorder (DVR) stores the number code on a metal disk inside a device called a hard drive. Unlike other video-recording devices, a DVR can show a TV program even while it is still being recorded.

History

The first successful videotape recorder was introduced in 1956. It was very expensive and was used mainly by TV broadcasters. From then on, recorded TV shows almost completely replaced live broadcasts. VCRs became common in homes starting in the 1970s. Camcorders that used videotape appeared in the early 1980s.

Digital video recording is a newer technology. DVDs and digital camcorders were introduced in the mid-1990s. Recordable DVDs and DVRs appeared a few years later. By the early 21st cen-

tury DVDs had mostly replaced videocassettes.

Vienna

Population
(2007
estimate), city,
1,664,150;
urban area,
1,954,960

Vienna is the capital of Austria, a country in central Europe. The city lies on the Danube River. It is Austria's largest city. It is also the country's center of industry, trade, and, especially, culture.

For centuries Vienna has been one of the world capitals of music. Operas and classical music concerts have played a major part in city life. Many great composers—including Ludwig van Beethoven, Wolfgang Amadeus Mozart, and Johannes Brahms—have lived in Vienna. The city is home to a world-famous orchestra, opera house, and boys' choir.

Vienna is famous for its palaces and other grand buildings. The Hofburg is a large group of buildings that originally housed Austria's royal family. One of its buildings now houses the Spanish Riding School and its performing horses of the Lipizzaner breed.

The Schönbrunn Palace near Vienna was once the summer home of the Hapsburg family. The Hapsburgs were the ruling family of Vienna and Austria for many years.

Economy

The economy of Vienna is based on manufacturing and services such as trade, banking, and tourism. Many people in the city work for the government. Factories in Vienna make car parts, electrical machinery, and chemicals. Vienna also has many companies that develop medical

In addition to its music and history, Vienna is known for its many coffeehouses. Tourists and local people alike go to the coffeehouses to eat, drink, read, or visit with friends.

products, software, and other high-technology products.

History

Celtic peoples settled in the Vienna area in ancient times. In the 1st century AD the Romans established a military post at the site. Different groups later controlled Vienna.

Vienna was the capital of the Hapsburg family from the late 1200s until the early 1900s. The Hapsburgs ruled the Austria area as part of a series of powerful empires. Vienna was their capital. During their rule Vienna became one of the world's great cities.

The Ottoman Turks attacked Vienna in 1529 and again in 1683. They were defeated both times.

Hapsburg rule ended in 1918. Vienna then became the capital of the new country of Austria.

German troops captured Austria in 1938. During World War II Vienna was often bombed. Foreign troops controlled the city from 1945 to 1955.

Since then Vienna has again become an important city. It is one of the headquarters of the United Nations and other international organizations. Vienna's culture and architecture continue to attract tourists from all over the world.

Vientiane

Population
(2003
estimate), city,
194,200;
(2005
estimate), urban
area, 702,000

Vientiane is the capital of Laos, a country in Southeast Asia. It is the country's largest city by far. It lies on the Mekong River, which is a major transportation route. Vientiane is the main port for shipping goods into Laos.

Laos is a poor country with little industry. Vientiane is the country's center of business. It is also one of the main

manufacturing areas. Tourism is also slowly becoming part of Vientiane's economy.

Vientiane was founded in the late 1200s. It became the capital of the Lao kingdom in the 1500s. In 1778 Siam—which is now the country of Thailand—took control of Vientiane.

France controlled Laos from the late 1800s until the 1950s. Vientiane was the capital of Laos during French rule. In the 1950s France's colonies in Asia fought for independence. Many groups also fought for control of Vientiane. In 1954 Laos became an independent country. Vientiane remained its capital.

Vietnam

The Asian country of Vietnam split into northern and southern parts in 1954. After the long Vietnam War, the two parts of Vietnam reunited in 1976. Vietnam's capital is Hanoi.

Geography

Vietnam is a long, narrow country in Southeast Asia. It shares borders with China, Laos, and Cambodia. The South China Sea lies to the east and south. The Gulf of Tonkin lies to the northeast, and the Gulf of Thailand is to the southwest.

Mountains cover about two thirds of the land, especially in the north. The Mekong River forms a delta, or triangle of rich land, in the south.

Vietnam has a warm, rainy climate. Storms called typhoons (like hurricanes) sometimes strike during the warmest seasons.

People live in houseboats on the Gulf of Tonkin in northern Vietnam.

Plants and Animals

Forests of oak, beech, pine, teak, and ebony trees cover about a third of the land. Bamboo plants grow in many places. Mangrove trees grow along the coast.

Deer, elephants, tigers, leopards, bears, and monkeys live in the forests. Vietnam also has crocodiles, boars, jackals, otters, skunks, and flying squirrels.

People

Most of the people are Vietnamese. Chinese and Hmong peoples form small groups in the north. In the south there are small groups of Khmer (or Cambodians) and Cham. Many other small groups live in the mountains.

The country's main language is Vietnamese. Many people also speak Chinese, Khmer, English, French, or a local language. Buddhism is the major religion. Vietnamese religions and Chris-

tianity are also common. Most of the people live in villages in the river deltas.

Economy

Most of Vietnam's workers are farmers. The most important crop is rice. Other food crops include cassava, corn, sweet potatoes, and peanuts. Farmers also grow sugarcane, coffee, tea, and rubber trees. They raise ducks, pigs, cattle, and buffalo.

Vietnam's factories make food products, clothing, shoes, cement, chemicals, steel, and electronics. Vietnam also produces coal, oil, and other minerals.

History

The first Vietnamese lived in a kingdom called Nam Viet beginning in 207 BC. China soon conquered Nam Viet. The Vietnamese gained independence from China in AD 939.

French Rule

France invaded the region in the 1800s. By 1883 the French controlled all of

Vietnam. France later combined Vietnam, Cambodia, and Laos into one territory called French Indochina.

After World War II a Communist group called the Viet Minh took control of northern Vietnam. In 1946 a war broke out between the French and the Viet Minh. The Viet Minh won the war in 1954.

Vietnam War

Vietnam was then divided into two parts. North Vietnam set up a Communist government. A president with strong powers ruled South Vietnam.

Communist rebels called the Viet Cong soon began fighting the government of South Vietnam. North Vietnam supported the rebels. The United States supported South Vietnam. In 1965 the United States began bombing North Vietnam. It also sent U.S. soldiers into the south. However, the United States could not defeat the Communists. Communist forces took over South Vietnam by 1975.

Recent History

North and South Vietnam joined together in 1976. In 1978 Vietnam attacked Cambodia. Vietnam's actions led to trouble with China and other countries. Vietnamese forces finally left Cambodia in 1989. Vietnam's relationships with other countries then began to improve.

Vietnam War

The Vietnam War was a long conflict in Southeast Asia. It began in 1954, after the country of Vietnam was split into two parts, North Vietnam and South Vietnam. North Vietnam wanted to reunite the country under Communism, its political and economic system. South Vietnam fought to keep this from happening. The United States helped South Vietnam, but North Vietnam won the war in 1975. Soon Vietnam was a united, Communist country.

The Vietnam War had a huge cost in human lives. More than 1.3 million Vietnamese soldiers and about 58,000 U.S. troops were killed. More than 2 million civilians (people not fighting the war) also died.

Background

Vietnam had many troubles before the Vietnam War. In the early 1900s the country was part of a French colony. Japan seized the colony in 1940 and

held it until 1945. Then a Vietnamese group called the Viet Minh declared Vietnam's independence. But the French still wanted to rule Vietnam as a colony. The two sides fought an eight-year war, called the French Indochina War. The Viet Minh defeated the French in 1954.

France and the Viet Minh then took part in a meeting to decide what would happen to Vietnam. People from the United States, the Soviet Union, and several other countries also participated. The meeting divided Vietnam into North and South Vietnam. The Viet Minh got control of North Vietnam. A Communist named Ho Chi Minh was the president. The Vietnamese who had supported the French got control of South Vietnam. Ngo Dinh Diem, who opposed Communism, led the south. The French soon left the country.

Civil War

By 1957 Communist rebels in South Vietnam had begun fighting Diem's government. They were called the Viet Cong. The Viet Cong hid by day and attacked by night. The North Vietnamese army trained and supported the Viet Cong. Communist fighters from the north later joined the fighting themselves.

The United States supported Diem because U.S. leaders hated Communism. U.S. military advisers trained the South Vietnamese army. Nevertheless, the Viet Cong seized control of much of South Vietnam in the early 1960s.

The Vietnam Veterans Memorial is in Washington, D.C. It includes a wall with the names of U.S. soldiers who died or were missing because of the Vietnam War.

U.S. Marines wade through a marsh during the Vietnam War.

Meanwhile Diem was losing support among the South Vietnamese people. One reason was his harsh treatment of followers of the Buddhist religion. Most Vietnamese were Buddhist, but Diem was a Roman Catholic. Diem imprisoned and killed hundreds of Buddhists. More and more people turned against him. In 1963 members of the South Vietnamese army murdered Diem. A group of army officers took over the government.

More U.S. Troops Arrive

The United States continued to help South Vietnam. In August 1964 the North Vietnamese attacked a U.S. warship in a waterway called the Gulf of Tonkin. Afterward the U.S. Congress gave President Lyndon B. Johnson the power to expand the U.S. role in the Vietnam War.

By 1968 the United States had more than 500,000 troops in Vietnam. Small units from South Korea, Australia, New Zealand, Thailand, and the Philippines also helped the South Vietnamese. The

Communist governments of the Soviet Union and China supported North Vietnam and the Viet Cong.

U.S. warplanes dropped bombs on highways and bridges in North Vietnam. The United States also bombed the Ho Chi Minh Trail, a Viet Cong supply road in Laos and Cambodia. Soon U.S. bombers were striking Hanoi and other North Vietnamese cities.

In February 1968, during a Vietnamese holiday called Tet, the Communists attacked about 30 cities in South Vietnam. The Viet Cong suffered heavy losses in these battles. But many U.S. soldiers died, too. Some people in the United States started to think that the war could not be won. Other people protested the war.

U.S. Troops Leave Vietnam

In 1968 President Johnson gradually ended the bombing of North Vietnam. Peace talks began. In 1969 Richard M. Nixon became president. Nixon began

People march in New York City in 1968 to protest the Vietnam War. Many Americans were against the war. They participated in protests and demonstrations.

to remove U.S. troops from Vietnam. But he also started bombing North Vietnam again, and he expanded the war to neighboring countries. U.S. and South Vietnamese troops attacked North Vietnamese and Viet Cong hiding places in Cambodia and Laos.

In January 1973 North and South Vietnam, the Viet Cong, and the United States signed an agreement to stop fighting. The United States then removed almost all its troops from Vietnam. But the war did not end. The United States continued to give money and equipment to South Vietnam.

The War Ends

In August 1974 the United States cut back its military aid to the south. The South Vietnamese army fell apart quickly after that. In 1975 the North Vietnamese launched a massive invasion of South Vietnam. North Vietnamese troops entered Saigon, the capital of South Vietnam, on April 30, 1975. The war was over, and the Communists had won. Thousands of South Vietnamese people fled the country.

In 1976 the Communists combined North and South Vietnam into one country, called Vietnam. They made Hanoi the capital. They renamed Saigon as Ho Chi Minh City in honor of Ho, who had died in 1969.

Vikings

A picture from a handwritten book shows the Vikings in their ships. They are preparing to attack the island of Great Britain.

The Vikings, who are also called Norsemen or Northmen, were warriors from northern Europe. They sailed the seas from the late 700s to the 1000s. They attacked many countries and took away much treasure. Their northern European neighbors gave them the name of Viking, which means “pirate.”

People

The homeland of the Vikings was in the region that is now called Scandinavia. The region now contains the modern countries of Denmark, Norway, and Sweden. Vikings also settled peacefully on Iceland, Greenland, and other islands in the North Atlantic Ocean. At home the Vikings were farmers. They belonged to clans, or large families, and were ruled by chiefs.

Did You Know?

The U.S. government sometimes used the term Vietnam Conflict instead of Vietnam War because the United States never officially declared war.

The Vikings were good sailors. They sailed in ships called longships. Rowers and sails moved the longships across the seas. In about 1000 a Viking named Leif Eriksson sailed all the way to North America.

The Vikings also were fierce warriors. The gods they worshipped were warriors, too. Their chief god was called Odin. Odin ruled over a warrior heaven called Valhalla.

The Vikings buried their chiefs with the supplies they thought they would need to get to Valhalla—tools, weapons, and even boats. Modern scientists have learned much about Viking life by opening Viking graves.

Writings called sagas provide even more information about Vikings. Sagas are Viking stories that Icelanders wrote down in the 1100s and 1200s.

Conquests

Vikings first attacked England in the late 700s. In 865 a Viking group from Denmark called the Danes conquered several

English kingdoms. The English drove out the Danes in 954, but the Danes soon returned. The Danish king Canute I ruled England from 1016 to 1035 as a part of his Viking empire. England finally threw off Danish rule in 1042.

However, in 1066 the Normans conquered England. The Normans were descendants of Vikings who had settled in France. The name Norman means “Northman.”

Vikings first attacked Ireland in 795. They started several kingdoms there. They threatened all of Ireland until 1014, when the Irish beat them in the battle of Clontarf.

Some Vikings roamed eastward. They attacked and looted the coasts of the Baltic Sea. After invading Russia, they moved far inland and mixed with the native people. The name of Russia comes from a Viking word.

After the 1000s the Vikings were no longer an independent group of warriors. Some mixed with the peoples of the lands that they conquered. Others settled down in their homelands. Eventually they also became Christians.

Villa, Pancho

Pancho Villa was a leader of the Mexican Revolution in the early 1900s. Some

people called him a dangerous revolutionary. Many others saw him as a defender of the poor.

Pancho Villa was born on June 5, 1878, in San Juan del Río, in northern Mexico. His name at first was Doroteo Arango. As a young man he led a gang of criminals and changed his name to Francisco Villa. Pancho was a nickname.

The president of Mexico, Porfirio Díaz, was hard on the common people. Villa helped a leader named Francisco Madero to overthrow Díaz in 1911. This began the Mexican Revolution. Victoriano Huerta, who was Madero's army chief, did not trust Villa. He put Villa in prison. But Villa escaped to the United States. In 1913 Huerta seized control of Mexico from Madero. Then Villa returned to Mexico.

Pancho Villa

Villa put together a group of fighters called the Division of the North. In 1914 Villa and Venustiano Carranza, another leader of the revolution, defeated Huerta. Carranza became the new leader of Mexico.

Carranza and Villa soon turned against each other. Carranza forced Villa and Emiliano Zapata, another rebel leader, out of Mexico City, the capital. In 1915 the United States gave its support to Carranza. Villa then murdered U.S. citizens in both Mexico and the United States. U.S. soldiers invaded Mexico in 1916, but they did not find Villa.

Carranza was overthrown in 1920. Then Villa stopped fighting the government. Someone killed Villa on his ranch near Parral, Mexico, on June 20, 1923. Police never solved the murder.

Vilnius

Population
(2008 estimate)
544,200

Vilnius is the capital of Lithuania, a country in northeastern Europe. It is the largest city in Lithuania.

The cathedral of Vilnius stands at the end of a street in the city's Old Town. The original cathedral was built in the 1300s. The current building dates from 1801.

Service industries such as banking, trade, and tourism are important to the economy of Vilnius. The city is also a major manufacturing area. The leading industries include clothes making, food processing, and printing and publishing.

Vilnius dates back to about the 900s. In the 1500s the city grew as a trading center. For hundreds of years it was also a center of Jewish culture and learning.

Many countries—including Russia, Sweden, and Poland—controlled Vilnius throughout its history. The Soviet Union captured Lithuania in 1940.

German troops ruled Vilnius in the early 1940s, during World War II. The city suffered heavy damage. The Germans murdered nearly all the city's Jews. This was part of a mass killing called the Holocaust.

After the war the Soviet Union again ruled Lithuania. In 1991 Lithuania

became a fully independent country. Vilnius once again became its capital.

Vinegar

Vinegar is a sour liquid that is used to flavor and preserve food. It is made by putting alcohol through a chemical change called fermentation.

The word vinegar comes from the French words for sour wine. Vinegar that is made from grapes is called wine vinegar. But vinegar can be made from other foods as well. Vinegar made from apples is called cider vinegar. Vinegar made from barley or oats is called malt vinegar.

The process of making vinegar starts with liquid that comes from the grapes, apples, or other foods. When a substance called yeast is added to the liquid it converts sugars in the liquid into alcohol. Tiny living things called *Acetobacter* bacteria then make the alcohol combine with oxygen in the air to form acetic acid and water. The acetic acid is what gives vinegar its sour taste.

Acetic acid is a strong acid. The vinegar that is sold in supermarkets is only about 4 percent acetic acid. Water and flavorings make up the other 96 percent.

Vinegar is used to add a sour taste to foods. Cooks make a sour salad dressing called vinaigrette by mixing vinegar with cooking oil and spices. Cooks also use

vinegar to preserve foods. This practice is called pickling. Pickles are cucumbers that have been pickled. Many other kinds of vegetables and fish can also be pickled.

Acid and Base • Fermentation

Violet

Violets are popular garden plants with delicate flowers. They also grow in the wild. There are about 500 species, or types, of violet. They include the common blue violet and the pansy. The popular houseplants called African violets are not in the same family as true violets.

Violets grow in places that have warm summers and cold winters. They are hardy plants and can grow well under trees and shrubs. The smallest violets are about 2 inches (5 centimeters) high. The largest can reach a height of more than 20 inches (50 centimeters).

The common blue violet has heart-shaped leaves and purple or white flowers.

Did You Know?

Some people use vinegar to treat wasp stings. However, the vinegar treatment probably does not work.

Violets often have large, heart-shaped leaves. The flowers have five petals. They are most commonly deep purple, blue, or lavender. They also can be white, yellow, reddish purple, or a combination of colors.

Some people eat the flowers of violets. In addition, sweet-smelling violets are used to make perfume.

Viper

The vipers are a group of poisonous snakes that have sharp fangs. There are about 200 species, or types, of viper. Some of the deadliest snakes in the world are vipers. Well-known types include rattlesnakes and adders.

Vipers are found throughout the world except in Australia and Antarctica. They live in both dry and wet climates. Vipers may spend time on the ground, in trees, or in water.

Some vipers are less than a foot (30 centimeters) long. Others are more than 10 feet (3 meters) long. A viper's body may be thin or thick. The color ranges from tan to black to green. Vipers blend in well with their surroundings. This helps to protect them from their enemies.

Vipers have a triangular head. Many have scales that stand up straight above their eyes. These scales make it seem like the snake has horns. Vipers have long

The common adder is a viper. Common adders live on the island of Great Britain and in many other parts of Europe and Asia.

fangs compared to other snakes. When a viper closes its jaw, its fangs fold up against the roof of its mouth. Some female vipers lay eggs. Others give birth to live young.

Vipers do not really hunt for food. Instead they wait for small animals to come to them. Once a prey animal is near, a viper bites quickly and injects venom, or poison, into it. The prey usually dies nearby. The viper then finds the prey using its sense of smell. It swallows the prey whole.

Some types of viper are called pit vipers. Pit vipers have special organs called pits on both sides of their face. These pits help them sense heat coming from the body of their prey. Once a pit viper senses the heat, it can attack its prey even in the dark. Pit vipers include rattlesnakes, copperheads, fer-de-lances, and moccasins.

Virginia

Virginia has one of the longest continuous histories among the U.S. states. Its history dates back to the English settlement of Jamestown in 1607. Virginia was named for Queen Elizabeth I of England. She was often called the Virgin Queen because she never married. The state is also referred to as the Birthplace of Presidents. Eight presidents of the United States were born in Virginia, including George Washington and Thomas Jefferson. Richmond is the capital.

Geography

Virginia is located in the southeastern part of the United States. The Potomac River separates northeast Virginia from Maryland and Washington, D.C. The Atlantic Ocean runs along part of eastern Virginia. Tennessee and North Carolina border Virginia at the southern end. West Virginia and Kentucky border Virginia to the west.

Five different natural regions exist in the state. Eastern Virginia is a low-lying coastal plain. To the west of the coastal

Shenandoah National Park covers a large section of the Blue Ridge Mountains in Virginia. The mountains stretch from northeast to southwest through the western part of the state.

plain is a large region of low rolling hills. Further west is a highland region. It is the site of Mount Rogers, the highest point in the state. Most of western Virginia is a region of valleys and ridges. The region includes the Shenandoah River valley. A plateau region covers a small area in far western Virginia. It contains a maze of deep ravines and winding ridges. Virginia's weather tends to be mild and pleasant.

People

Most of Virginia is populated by people whose ancestors came from Europe. Northern Virginia, near Washington, D.C., tends to have a greater mix of ethnic groups than other parts of the state. More than 70 percent of Virginia's population is white. About 20 percent of

the population is African American, and about 5 percent is Hispanic.

Economy

About one fifth of Virginia's workforce is involved in public administration. These people are employed by the local, state, or federal government. Some of these are members of the military, such as the Marines stationed at the base in Quantico. Many military employees work at the Pentagon, the headquarters of the United States Department of Defense.

Major agricultural products in Virginia are chickens, cattle, and dairy goods. Important crops include tobacco, soybeans, and corn. The production of food products is the most valuable manufacturing industry in the state. Major products include processed meat, baked goods, and beverages. Chemical, computer, and electronic products are also profitable manufactured goods.

Tourism is a vital part of Virginia's economy. Many tourists visit sites related to the history of the United States. Some like to see historical buildings, such as the homes of presidents George Washington and Thomas Jefferson. Others are interested in Virginia's many American Revolution and American Civil War battlefields. Another popular tourism site is Colonial Williamsburg. The village looks much like it did in colonial times. To re-create the village's early years, actors behave and dress like early colonists.

History

Before the arrival of the English in the 1600s the largest group of Native Americans in the region was the Powhatan Confederacy. The first permanent English settlement in America was Jamestown, near Chesapeake Bay. It was named for James I of England, who was king when the settlers arrived in May 1607. The people of Jamestown had a hard time surviving during the first years. In 1624 Jamestown became an English royal colony.

Many farmers in Virginia became rich by growing and selling tobacco. England wanted to benefit from the money being made in Virginia and in other colonies in America. To do that, it kept putting taxes on the colonists. In May 1776, Virginia patriots asked the Continental Congress to declare the American Colo-

nies free from British rule. Members of that legislative body agreed. This decision led to the Declaration of Independence, which was adopted on July 4, 1776.

Virginia was the scene of many battles during the American Revolution. The war's final battle took place in Yorktown, Virginia. After the battle, the British commander surrendered to George Washington on October 19, 1781. The former colonies then turned to the task of creating a system of national government. Virginia's state constitution was used as a guide. In 1788 Virginia entered the Union as the new nation's 10th state.

Virginia legalized slavery in 1661. By the 1860s, however, states in the North wanted slavery to end. Southern states such as Virginia considered slave labor necessary to their economies. Eventually, Southern states withdrew from the Union to form their own government. This Southern government was known as the Confederacy.

Virginia joined the Confederacy in 1861. Richmond, Virginia, soon became the Confederate capital. The American Civil War began soon after the Confederacy was founded.

At the time, Virginia included what is now West Virginia. People in the western part of Virginia had smaller farms than those in the east, and they did not use slaves to run them. They often disagreed with the slaveholders in eastern Virginia. In 1863, more than 50 coun-

ties in northwest Virginia decided to become the separate state of West Virginia.

Virginia was the site of Bull Run and many other bloody battles during the Civil War. By April 1865, Confederate leaders realized that the South could not win. Confederate general Robert E. Lee surrendered to Union commander Ulysses S. Grant at Appomattox, Virginia. This surrender ended the war.

Virginia rejoined the Union in 1870. It took a long time for the state to rebuild all the structures that had been damaged during the war. It also took many years for African Americans in the state to gain the same rights as whites.

In the 20th century Virginia began to show characteristics of both the North and the South. Virginia's northern counties reflected the worldly city character of the nearby national capital, Washington, D.C. Other areas of the state remained more rural. In rural Virginia the history and culture of the Deep South could still be felt.

In the late 20th century some cities began to spread into the countryside. Some people in the state were unhappy with this growth. They complained that important American Civil War battlefields were sometimes threatened by people wanting to take over the land to build more houses.

Virunga Mountains

The Virunga Mountains are a mountain range, or group of mountains, in east-central Africa. They span parts of Uganda, Rwanda, and the Democratic Republic of the Congo. There are eight major peaks. All are volcanoes.

Six of the major peaks in the Virunga Mountains are extinct volcanoes, meaning that they no longer erupt. The extinct volcanoes are named Mikenno, Sabinio, Visoke, Mgahinga, Muhavura, and Karisimbi. Karisimbi is the highest peak in the Virunga Mountains. It is 14,787 feet (4,507 meters) high. It is on the border between Rwanda and the Democratic Republic of the Congo.

The other two major peaks are active volcanoes. This means that eruptions

Muhavura is one of the main peaks of the Virunga Mountains.

still take place there. The active volcanoes are named Nyiragongo and Nyamulagira. In 2002 a flow of lava, or melted rock, from Nyiragongo destroyed much of the city of Goma in the Democratic Republic of the Congo.

Forests on the slopes of the Virunga Mountains are home to the mountain gorilla. The mountain gorilla is very rare and in danger of dying out. All three countries in the region have set aside areas as national parks. In a national park, wild animals and their habitat are protected by law.

Virus

Viruses are tiny particles that cause disease in people, other animals, and plants. Different viruses cause the common cold, influenza (flu), chicken pox, measles, AIDS, and many other diseases.

Viruses are so tiny that people can see them only with powerful microscopes. Some viruses have a spherical, or round, shape. Others are shaped like rods. Viruses are made up mostly of a substance called nucleic acid surrounded by protein.

On its own, a virus is lifeless. However, it becomes active when it infects, or enters, a cell of an animal or a plant. Once inside a cell, a virus can reproduce itself, like living things can. The copies that a virus makes of itself are called virions. These virions can leave the origi-

Did You Know?

Antibiotic drugs kill bacteria but have no effect on viruses. Drugs that work against viruses are called antiviral drugs.

How a Virus Invades a Cell

A virus reproduces itself by taking over a living cell and making it into a virus factory.

nal cell and infect other cells. Viruses also can live in bacteria, which are living things made up of only one cell.

Humans and other animals have natural defenses against viruses. Fever is one important way that the human body fights viruses. A fever is when a body's temperature rises. A fever causes some viruses to become inactive. The body's immune system also fights viruses. It produces white blood cells and substances called antibodies to attack viruses. After these cells and antibodies have attacked a virus, they stay in the body. This prevents future infection by the same virus.

Doctors use vaccines to prevent many diseases caused by viruses. Vaccines are substances made from dead or weakened viruses. They prepare the immune system to fight off active forms of these viruses.

Vitamins

Vitamins are nutrients that humans need in order to grow, reproduce, and be healthy. Only two vitamins are made in the human body. People get most of the vitamins they need from food or vitamin pills.

Scientists have identified 13 vitamins: A, eight B vitamins, C, D, E, and K. These vitamins can be obtained through a healthy diet filled with a variety of

Apples and other fresh fruits contain many of the vitamins that growing children as well as adults need.

foods, including plenty of fruits and vegetables.

Vitamins D and K are both found in foods and produced by the human body. The body makes vitamin D when the skin is exposed to sunlight. Bacteria in the intestines produce vitamin K.

Certain vitamins (the B complex vitamins and vitamin C) dissolve in water. The body stores a small amount of these vitamins but gets rid of most of those it does not use. For this reason, people need to take in plenty of these vitamins every day.

Other vitamins (A, D, E, and K) do not dissolve in water. The vitamins that the body does not use right away are stored in the body's fat and liver. Getting too much of these vitamins can be dangerous over time.

Food and Nutrition

Volcano

A volcano is an opening in Earth's crust. When a volcano erupts, hot gases and melted rock from deep within Earth find their way up to the surface. This material may flow slowly out of a fissure, or crack, in the ground, or it may explode suddenly into the air. Volcanic eruptions may be very destructive. But they also create new landforms.

A Volcanic Eruption

During a volcanic eruption, hot melted rock called magma escapes from a vent, or opening, in Earth's surface, or crust. Magma released from a volcano is known as lava. Fresh lava ranges from 1,300° to 2,200° F (700° to 1,200° C) in temperature. It glows red as it flows out of the volcano's opening. As it cools, it hardens into rock.

Strong volcanic eruptions throw bits of magma into the air. These bits cool into tiny pieces of rock, called volcanic dust or volcanic ash. Wind can carry volcanic

An erupting volcano threatens a village in Indonesia. Glowing liquid rock called lava flows down the side. Clouds of smoke and ash fill the air.

During a volcanic eruption, lava flows from vents. Ash and gas shoot into the air.

dust thousands of miles away. Volcanic ash can coat the land for miles around the volcano.

Steam and poisonous gases also escape from volcanoes. Sometimes these gases mix with ash to create destructive fiery clouds.

Where Volcanoes Form

Earth's crust is made up of huge, rocky pieces called plates. The plates move slowly over the crust. Most volcanoes lie along the boundaries between these plates.

Some of the most violent eruptions take place where the edge of one plate is forced beneath the edge of another. This forces magma to rise to the surface. Hot gases in the magma make these volcanoes very explosive. Most volcanoes of this type are found around the edges of the Pacific Ocean. This huge circle of volcanoes is known as the ring of fire.

Volcanoes also form in places where two plates slowly pull apart. Molten rock rises through the gap between the plates. It causes fissure eruptions, in which lava flows out over the ground. This type of volcano is common along the Mid-Atlantic Ridge, a mountain chain under the Atlantic Ocean. Volcanoes in the northern part of this ridge formed the island country of Iceland.

A small number of volcanoes are not located along the edges of plates. They form at "hot spots" in Earth's crust. At a hot spot, molten rock rises from deep below the crust. The volcanoes of

Hawaii are the best examples of hot-spot volcanoes.

Volcanic Landforms

Volcanic eruptions create new landforms that are also called volcanoes. The two most common types are stratovolcanoes and shield volcanoes.

Stratovolcanoes are mountains shaped like cones. They have a narrow top with steep sides and a wide bottom. A crater, or bowl-shaped pit, usually lies at the

Volcanic Landforms

shield volcano

stratovolcano

complex volcano

caldera

somma volcano

Eruptions of volcanoes can create several different types of landforms.

top. Stratovolcanoes are made up of layers of hardened lava and ash. Thousands of eruptions left these layers over millions of years. Mount Fuji in Japan is a stratovolcano.

Shield volcanoes are dome-shaped mountains built by lava flows. They are not as steep as stratovolcanoes. The volcanoes of Hawaii are shield volcanoes.

Sometimes the top of a volcano collapses and forms a pit called a caldera. A caldera is larger than a crater. Some calderas fill up with water to form lakes. A somma volcano forms when a new volcanic cone partially fills a caldera.

A complex volcano has more than one vent. A volcano can have more than one vent when two cones overlap one another. Or a volcano can form new vents during an explosion.

Hot Springs, Geysers, and Fumaroles

Hot springs, geysers, and fumaroles are other types of volcanic activity. They happen in places where magma heats underground water. A hot spring is a place where warm water comes up through the ground. A geyser is a kind of hot spring that shoots water and steam into the air. Fumaroles are vents that release gas and steam.

Studying Volcanoes

Volcanology is the branch of geology that focuses on volcanoes. Scientists who study volcanoes keep track of earthquakes and other signs of volcanic activ-

Fissure Eruption

The mildest type of volcanic eruption consists of a flow of lava from fissures, or cracks, in the ground. This type of eruption takes place in Iceland.

ity. They try to predict when an eruption may take place.

History

Volcanoes have a long history of destruction. In AD 79 the eruption of Mount Vesuvius destroyed the Roman cities of Pompeii and Herculaneum. Two of the deadliest volcanic eruptions happened in 1815 and 1883 on islands in what is now Indonesia. The eruptions killed tens of thousands of people.

The 1980 eruption of Mount Saint Helens, in the U.S. state of Washington, was one of the biggest in North America. The 1991 eruption of Mount Pinatubo, in the Philippines, was the largest of the 1900s. These eruptions killed fewer people than earlier volcanoes, but they still destroyed much property.

Vole

Voles are small mammals that belong to the rodent family. They look like mice.

There are more than 100 species, or types, of vole. They are found in North America, Europe, and Asia. A small number of voles live in the African country of Libya. Voles can be found in many different habitats, including forests, prairies, and meadows.

Voles have small eyes and ears. Their snout is blunt rather than pointy. The tail is shorter than the body. Voles have long, soft fur that is usually gray, brown, or reddish in color.

Most voles grow between 4 to 10 inches (10 to 26 centimeters) long, including the tail. The woodland vole is one of the smallest. It weighs less than 1 ounce (35 grams) and is under 5 inches (13 centimeters) long. One of the larger voles is the European water vole. It weighs up to

Most voles live in underground tunnels. They come aboveground to find food.

9 ounces (250 grams) and is 14 inches (35 centimeters) long.

Voles are active year-round. They eat plants and sometimes insects. Most voles live in burrows, or underground tunnels. But some, such as the Sonoma tree vole, live in trees. Water voles are found near ponds and streams. They are excellent swimmers.

Volga River

The Volga is Europe's longest river. It flows 2,325 miles (3,740 kilometers) through western Russia. The Volga has played an important part in the life of the Russian people. In Russian folklore it is called Mother Volga.

The Volga begins in the Valdai Hills northwest of Moscow, Russia's capital. It flows generally southward to the Caspian Sea. Canals and other rivers connect the Volga to the Baltic Sea, the White Sea, the Sea of Azov, and the Black Sea.

The Volga River now has dams to control flooding. People build houses close to the riverbank because they are not afraid of rising waters.

The Volga gets about 60 percent of its water from melting snow. The rest of its water comes from underground sources and rainfall. The Volga used to flood during the spring. Today dams and artificial lakes called reservoirs store its water and prevent floods.

The Volga is important to Russia's economy. Power stations at the reservoirs use the river to produce electricity. Boats on the Volga carry more than half of the goods shipped within Russia. Construction materials, including timber, make up most of the shipments. Many passenger boats also use the Volga.

Volleyball

Volleyball is a team sport in which players use their hands or arms to knock a ball over a net. Two teams, usually with six players each, compete in a volleyball

game. Volleyball can be played inside, in a gym, or outside, on a beach or in a park.

Court and Equipment

Volleyball is played on a court that is 30 feet (9 meters) wide by 60 feet (18 meters) long. A center line divides the court into two equal areas. A net runs along the center line. Each team defends one side of the net. A volleyball is filled with air and weighs 9 to 10 ounces (260 to 280 grams).

Playing the Game

Play begins when one player serves. A player serves by hitting the ball over to the receiving team's side of the net. The receiving team tries to return the serve, or hit the ball back over the net. The receiving team can return the serve with a single hit. More often, though, the receiving team tries to set the ball. To do this, players hit the ball into the air on their own side of the net. A good set allows a teammate to drive the ball over

Many people enjoy playing a casual game of volleyball at the beach or in a backyard.

the net with great force. This makes it harder for the other team to hit it back.

The teams hit the ball back and forth over the net until one team scores a point. A team scores a point when it lands the ball on the floor inside the other team's playing area. A team also scores a point if the other team hits the ball out of bounds or makes some other error. Scoring 25 points wins a game. A team has to win by at least two points.

Players from Cuba and China face each other during an international volleyball tournament.

History

William G. Morgan invented the game of volleyball in 1895 at the Young Men's Christian Association (YMCA) in Holyoke, Massachusetts. It quickly became popular in schools and on playgrounds throughout the United States. In the early 1900s the sport spread throughout the rest of the world. In 1947 an organization called the Fédération Internationale de Volleyball (FIVB) was formed to govern the sport worldwide. In 1964 volleyball became a sport for both men and women in the Summer Olympics.

Today the FIVB sponsors several other international tournaments as well.

Voting

Voting is a process by which a group of people can decide things fairly when they do not all agree. Voting is an important part of the type of government called democracy. In a democracy people use voting to choose government leaders. They also may vote for or against certain laws or projects in their community. The right to vote is called suffrage.

Elections

When a group of people votes, it is called an election. In an election for a government job, the people who want the job are called the candidates. Candidates often run a campaign before an election. During a campaign a candidate tries to convince voters that he or she is

right for the job. Candidates often make speeches and run advertisements on television.

On election day people usually go to a polling place to vote. Polling places are often in schools, community centers, or other public buildings. At the polling place people vote for their favorite candidate. They use a machine to make their choice, or they mark their choice on a form called a ballot. Everyone's choice remains secret. After the election, machines or election workers count the votes for each candidate. The candidate with the most votes usually wins the election.

The Right to Vote

Every country that holds elections sets its own rules about who can vote. Today most countries allow nearly all adult citizens to vote. Sometimes people who have committed serious crimes cannot vote. People who have certain mental disabilities sometimes cannot vote either.

In the past many countries allowed only white men to vote. In the United States African American men gained the right to vote in 1870, after the end of slavery. Women in New Zealand, Australia, the United Kingdom, and the United States won the right to vote by 1920. Women in most other countries gained suffrage by the end of the 1900s. Black men and women in South Africa first voted in national elections in 1994.

Vulture

Vultures are large birds of prey. Unlike other birds of prey, vultures usually do not hunt for live animals. They mostly eat dead meat and garbage instead.

When one vulture finds a dead or dying animal, others fly in from miles away to share in the meal.

Some of the biggest of all flying birds are vultures. Vultures can fly for hours, soaring gracefully on their long, broad wings. Their feathers are usually brown, black, or white. However, most vultures do not have feathers on their heads and necks. Vultures have excellent eyesight.

Vultures live mainly in warm regions. There are two groups of vultures, New World vultures and Old World vultures. They have many similar characteristics, but they are not closely related.

A source of food attracts crowds of vultures in Africa. Dead animals and garbage form most of their diet.

New World Vultures

The New World vultures live in North and South America. They are probably related to storks. These vultures do not build nests. Females lay their eggs on cliffs or in trees. Larger types of New World vulture lay one egg at a time. Smaller types lay two.

The black vulture is a New World vulture that is about 24 inches (61 centimeters) long. The California condor is a huge New World vulture. It may reach 55 inches (139 centimeters) long with a wingspread of about 9.5 feet (2.9 meters). The California condor nearly died out in the late 20th century, but scientists are trying to save it. Other New World vultures include the turkey vulture and the Andean condor.

Old World Vultures

The Old World vultures live in Europe, Asia, and Africa. They are closely related to eagles and hawks. Old World vultures build nests out of sticks on cliffs or in trees. Sometimes many vultures build nests in groups called colonies. The larger types usually lay one egg at a time.

The cinereous vulture is a large bird in this group. It is about 39 inches (99 centimeters) long. The lappet-faced vulture is about the same size. Large folds of skin, called lappets, hang down from its head. Other Old World vultures include the griffon vulture and Egyptian vulture.

Wales

Wales is part of the United Kingdom, a country of western Europe. The other three parts of the United Kingdom are England, Scotland, and Northern Ireland. The people and the special language of Wales are called Welsh. In the Welsh language, Wales is known as Cymru. The capital of Wales is Cardiff.

Geography

Wales is in the southwestern part of the island of Great Britain. It borders England on the east. On the other three sides it is surrounded by water. The land is rugged. The Cambrian Mountains extend from north to south through Wales. The other major mountain areas are the Snowdonia in the north and the Brecon Beacons in the south. The coast has many cliffs and beaches. The Severn, Wye, and Dee

are the longest rivers. The climate is cool and wet.

People

The Welsh people can trace their roots back to the Celts. The Celts were people who lived in the area thousands of years ago. The Welsh language came from the language of the Celts. About one fifth of the people of Wales speak Welsh. English is the other main language. Schools have classes in both English and Welsh. Most of the Welsh people are Protestant.

Economy

Most of the people of Wales work in services such as government, education, banking, and tourism. Manufacturing, farming, and forestry are also important to the economy. Factories make electrical, automotive, chemical, and metal products. Farmers raise sheep, cattle, and poultry. Major crops include barley, wheat, potatoes, and oats.

History

The Celts lived in Wales in prehistoric times. The Romans invaded in the 1st

Conwy Castle is one of many castles in Wales. King Edward I of England had it built in the 1280s.

century AD. The Romans used the name Britons for the Celts they found. Roman rule ended in about 400. Then a number of new Celtic kingdoms were formed. The English considered the Britons to be Welsh. The name Welsh comes from an Old English word meaning “foreigner.” But the people of Wales called themselves Cymry, which means “countrymen” in Welsh.

In the 800s and 900s Welsh princes tried to unite the kingdoms. They were not successful. In 1093 French invaders, called the Normans, brought all of southern Wales under their rule. In the 1100s and 1200s the kings of England made several attempts to conquer Wales. King Edward I was finally successful in 1277. In 1301 he gave his son the title prince of Wales.

In 1401 the Welsh revolted against the English. For a few years Wales was independent. By 1410, however, the English had regained control. In 1536 Wales was officially united with England. In 1801 Wales became part of the United Kingdom along with England, Scotland, and Ireland. (Later most of Ireland split from the United Kingdom, but Northern Ireland remained.)

In the 1800s and 1900s the people of Wales worked for the right to govern themselves. In 1997 the people voted to form a lawmaking body of their own. The body, called the National Assembly for Wales, was formed in 1999. It took

control of many things that the national Parliament in London had handled before.

Walkingstick

A walkingstick rests on a plant. The insect's color and shape make it look like a twig.

Walkingsticks are insects that look like the twigs of a plant. They are also called stick insects. There are about 2,000 species, or kinds, of walkingstick. They are most numerous in the tropics.

Walkingsticks are long and thin. They can be more than 12 inches (30 centimeters) long. Tropical species are the largest. Walkingsticks have wings, but they do not fly. Instead they walk with a rocking motion that makes them look like a stick being blown in the wind.

Lizards and birds eat walkingsticks. The insects try to blend in with their surroundings so they will not be noticed. Walkingsticks are green or brown, which makes them look like the plants on which they feed. Some species have sharp spines or give off a bad smell to help keep enemies away. If a walkingstick loses legs or antennas to an enemy, it can grow new ones.

Female walkingsticks scatter their eggs on the ground. The eggs of some walkingsticks look like seeds. This helps keep the eggs from being discovered. The eggs hatch within several months. A walkingstick usually lives for less than a year.

Walrus

The walrus is a large mammal that lives in cold Arctic seas of Europe, Asia, and North America. It is closely related to the seals. The walrus can be told apart from seals by the two large upper teeth, called tusks, that stick down from its

Walrus often live in large groups.

mouth. The scientific name of the walrus is *Odobenus rosmarus*.

The walrus has a stocky body and a rounded head. It has flippers instead of legs. Its mouth is covered with stiff whiskers. The skin is wrinkled and grayish brown. A thick layer of fat below the skin, called blubber, keeps the walrus warm. Walrus can be 12 feet (3.7 meters) long and weigh more than 2,600 pounds (1,200 kilograms).

The walrus has a tusk on each side of its mouth. The tusks can be 3 feet (1 meter) long. The walrus uses its tusks to fight. It also uses them to cut holes in ice and to pull itself out of water.

Walrus live in groups that can include more than 100 animals. They spend most of their time in the sea. They sometimes rest on ice or rocky islands. In the water a walrus uses its flippers to swim. On land it turns its rear flippers forward under its body to waddle around.

Walrus eat mostly clams. They dig clams from the seafloor with their tusks. They shovel food into the mouth with their whiskers.

Wampanoag

The Wampanoag are a Native American people of New England. They traditionally lived in villages in Massachusetts, Rhode Island, and on nearby islands.

An engraving shows a Wampanoag man dressed for battle.

The Wampanoag built dome-shaped houses called wigwams. Several families lived in each wigwam. The Wampanoag hunted and fished. They also grew corn, beans, and squash.

The Wampanoag were the first Native Americans to deal with the English settlers known as the Pilgrims. The Pilgrims established a colony at Plymouth, Massachusetts, in 1620. Massasoit, the Wampanoag chief, made a peace treaty with the Pilgrims that lasted for 40 years. The Wampanoag taught the Pilgrims the skills they needed to survive in their new home.

Massasoit died in 1661. By that time the relationship between the Wampanoag and the settlers had become tense. Some settlers were taking Wampanoag lands without payment. Massasoit's son Metacom—known to the Pilgrims as King Philip—became chief in 1662. He

got other tribes to help the Wampanoag fight the settlers in what became known as King Philip's War. Metacom was killed, and the Wampanoag were defeated.

The Wampanoag survivors fled their lands. Some traveled to the islands of Nantucket and Martha's Vineyard. At the end of the 20th century there were about 2,000 Wampanoag, mostly on Martha's Vineyard.

Wapiti

The wapiti is a North American deer that is often called American elk. Scientists sometimes consider wapiti to be of the same species, or type, as the red deer of Eurasia. The wapiti is the second largest deer after the moose. Its scientific name is *Cervus canadensis*.

A male wapiti blends in with the dry grass of a meadow in Yellowstone National Park in the U.S. state of Wyoming.

At one time wapiti roamed over most of North America. They are now only in the northwestern United States and southwestern Canada. Wapiti like open woodlands and mountain meadows.

Wapiti weigh about 650 to 1,100 pounds (295 to 500 kilograms). Males may stand taller than 5 feet (1.5 meter) at the shoulder. Wapiti have brown fur with a yellowish white patch on the rump. The shoulders and neck are covered with long, shaggy, dark brown hair. Males have large antlers that are shed and regrown each year.

Wapiti eat a variety of grasses and plants. They generally look for food in the early morning and late evening. In the winter they stay in large groups, but in the summer they break up into smaller ones. In early summer the females give birth to one white-spotted calf.

Italian explorers visited Wappinger territory in 1524. In 1609 an English explorer named Henry Hudson arrived. He was working for the Dutch. Hudson claimed the tribe's land for the Netherlands.

The Wappinger gladly traded animal furs to the Dutch for European goods such as metal pots and tools. But the Wappinger also caught diseases such as smallpox and measles from the Dutch. Many Wappinger died of disease.

In the early 1640s the Wappinger and other nearby Indians went to war against the Dutch. They were trying to protect their land from Dutch settlers. The Indians lost the war in 1645.

Most of the surviving Wappinger joined the Nanticoke tribe in the middle of the 1700s. These Wappinger and Nanticoke later merged with other tribes, including the Delaware (Lenni Lenape) and the Mohican. By the 1800s the Wappinger were no longer a separate people.

Delaware • Mohican • Native Americans

Did You Know?

Wappinger chiefs were called sachems. Both men and women could become sachems.

Wappinger

The Wappinger were a group of seven Native American tribes. They lived in what are now New York State and Connecticut.

The Wappinger lived in bark-covered homes called wigwams. They also lived in longhouses. Longhouses were large enough for several related families. They grew corn and other crops. They also hunted and fished.

War

When countries or other large groups of people use weapons to fight each other, the fight is called a war. Throughout history groups of people have used war as a way of settling differences.

Types of War

There are two main kinds of war: international and intranational.

International wars are fought between countries or groups of countries. The Iran-Iraq War (1980–90) was an international war between two countries, Iran and Iraq. World War I (1914–18) and World War II (1939–45) were international wars fought between groups of countries.

Intranational wars are fought between groups within a country. Intranational wars are also known as civil wars, rebellions, or revolutions. Civil wars are wars between two groups of citizens of the same country. The American Civil War (1861–65) started when the Southern states seceded, or separated, from the United States. The Northern states fought to keep this from happening. A rebellion is when citizens rise up against their government and demand change. It may or may not be successful. Revolutions are like rebellions, but in a revolution a group succeeds in overthrowing

the existing government. That group usually establishes a new government.

Causes of War

Countries and other groups of people go to war with one another for a number of reasons. A country may feel that it does not have enough land or resources. It then may try to take these things from a neighboring country by force. Sometimes groups fight wars simply because one group wants to show it is more powerful than another. Civil wars can start when a group within a country wants more power or money. A group also may fight to gain religious freedom.

History

Early Wars

In the earliest wars people fought with simple weapons—for example, wooden clubs, rocks, spears, and bows and arrows. After people learned how to use metals, they fought with swords and

Warriors in ancient times fought on foot, on horseback, on war elephants, and on wheeled vehicles. They fought with bows and arrows, spears, and other weapons. They protected their bodies with shields and armor.

other sharp weapons. They also made better bows and arrows.

For many centuries people fought on foot. About 4,000 years ago armies began to use horses to pull carts called chariots. Armed fighters later began to ride horses into battle.

European fighters first used gunpowder in the 1300s. They used it to blast castle walls and to shoot arrowlike missiles from tubes. Europeans invented the big guns called artillery, including cannons, during this time. In the mid-1400s European inventors made the first rifles and handguns. For the first time soldiers on foot could carry guns.

Modern War

A huge change in war happened in the 1800s, during the Industrial Revolution. (The Industrial Revolution was a time when people invented new ways to make goods quickly and cheaply.) Large numbers of guns became available for armies. Guns also

became more powerful and accurate. The first machine guns appeared in the late 1800s.

Other inventions allowed people to fight much larger wars. Steam engines allowed warships to move around without depending on wind. Telegraphs allowed fast communication between troops. Railroads moved troops and supplies farther and faster. All these new developments made war much more destructive.

The next major advance in war came with the use of airplanes during World War I. Pilots could now drop bombs from the air. Armies also used tanks, submarines, and chemical weapons (weapons that released poisonous gas) during this war.

During World War II tanks and many other kinds of weapons improved. But the biggest change of all was the development of the atomic bomb, the first nuclear weapon. The United States dropped two atomic bombs on Japanese cities during World War II. These bombs killed more than 100,000 people instantly.

After World War II a group of countries formed the United Nations. This organization tries to keep countries from going to war. Many countries also agreed to some new rules of war. These rules are included in a set of agreements called the Geneva Conventions. One of the rules is that warring countries should try

Warhol, Andy

Andy Warhol was a U.S. artist famous for his paintings of Campbell Soup cans and portraits of celebrities. Warhol himself became a celebrity, in part because of his unusual personality and sense of style.

Andrew Warhola, as he was originally named, was born in Pennsylvania in about 1928. He studied art at the Carnegie Institute of Technology. After graduating in 1949, he moved to New York City. There he drew illustrations for advertisements. But he wanted to be an artist whose works were shown in art galleries.

In 1962 Warhol showed some of his paintings at a gallery. He had painted 32 pictures of different flavors of Campbell's soup. The soup cans were all painted in the same flat style.

Warhol's paintings were a new kind of art. Warhol took familiar objects and made them into art. Warhol and other artists were called pop artists because they took images from popular culture, or everyday life.

By 1963 Warhol had begun to make pictures from photographs. He started creating portraits of such stars as Mari-

Andy Warhol created paintings of everyday objects and celebrities.

lyn Monroe and Elvis Presley. He made numerous portraits of the same person using different bright colors for each picture.

Warhol called the place where he created his art the Factory. Unlike other artists, he did not treat his works as unique. Instead he mass-produced his art, similar to the way factories make products. The Factory became a place for unusual and famous people to meet. Warhol worked with some of these people to create films. The films were known for not having plots and for being very long.

In 1968 one of Warhol's followers shot and nearly killed him. After recovering, Warhol continued to make art. He died in New York City on February 22, 1987.

The War of 1812 was the second war between the United States and Great Britain. The United States won its independence in the first war—the American Revolution. Neither country won anything important in the War of 1812.

In the early 1800s Great Britain was fighting a war against France. The

People who lived in newly settled areas of the United States were also angry with Britain. They accused the British of getting Native Americans to attack settlers.

Henry Clay of Kentucky led a group in Congress called “war hawks.” The war hawks got President James Madison to sign a declaration of war against Britain on June 18, 1812.

Early Battles

The United States was not ready for war. The Army first tried to take Canada, which belonged to Britain. The attacks failed. Britain struck back by taking Detroit, Michigan. The U.S. Navy was more successful at first. The USS *Constitution* (“Old Ironsides”) won several battles in the Atlantic.

U.S. forces won two notable victories in 1813. On September 10 ships commanded by Oliver Hazard Perry defeated British ships on Lake Erie. He then helped recapture Detroit. In October, Perry’s ships and troops commanded by William Henry Harrison chased the British into Canada. There the U.S. forces defeated the British in the battle of the Thames. The Native American leader Tecumseh died while helping the British. After this battle, most of the Native Americans stopped fighting.

Later Battles

These victories did not stop the British, however. In August 1814 British troops sailed up Chesapeake Bay and entered Washington, D.C. They burned the White House and other government buildings. They then tried to capture Baltimore, Maryland, but failed. Francis Scott Key wrote the words to “The Star-Spangled Banner” after this battle.

A painting shows the USS *Constitution* and a British warship fighting a sea battle during the War of 1812. Smoke from the guns fills the air between the ships.

On January 8, 1815, British soldiers attacked troops led by Andrew Jackson at New Orleans, Louisiana. Jackson’s forces defeated the British. Both sides fought this battle without knowing that their countries had signed a peace treaty in Ghent, Belgium, on December 24, 1814.

The war was over, but there was no clear winner. The boundaries returned to where they were before the war. Andrew Jackson and William Henry Harrison were considered heroes because of the battles that they won. Both were later elected president of the United States. Another result of the war was that the United States became more independent from Europe. The country developed more of a sense of national identity.

Warsaw

Population
(2008 estimate)
1,706,620

Warsaw is the capital of Poland, a country in eastern Europe. It is Poland's largest city and center of culture. Warsaw lies on a flat plain. The Vistula River cuts through the city.

Many people in Warsaw work in service industries such as trade, insurance, education, and tourism. The city is Poland's center of banking. Factories in Warsaw make electronics, cars, processed foods, and other products.

Most of the buildings in the older section of Warsaw, Poland, were rebuilt after World War II. The builders made them look just like the old buildings that were destroyed in the war.

Warsaw was once a small trading settlement. The town grew after a castle was built there in the late 1200s. It became the capital of Poland in 1596.

Warsaw survived great destruction several times. Sweden attacked the city in the 1650s. Russia invaded Warsaw in the 1790s.

Poland fell under foreign rule in the late 1700s. In 1918, after World War I, it became an independent country again. Warsaw was its capital.

Nazi troops from Germany ruled Poland during World War II, from 1939 to 1945. They murdered hundreds of thousands of Jews, Poles, and other people from Warsaw. This was part of a mass killing called the Holocaust.

The Nazis forced Warsaw's Jews to live in terrible conditions in an area called a ghetto. In 1943 the Jews fought an uprising against the Nazis. The Jews were greatly outnumbered, however. The Nazis recaptured the ghetto and destroyed it.

The people of Warsaw fought the Nazis again in 1944, but they lost. The Nazis then destroyed most of the city.

After the war Warsaw was rebuilt. By the end of the 20th century the city's population was larger than it had been before the war.

Washington

The U.S. state of Washington is called the Evergreen State because of its great fir, pine, and hemlock forests. It is also sometimes called the Chinook State, after a Native American tribe of the Columbia River area. Washington is the only state named after a president—George Washington. Olympia is the capital.

Geography

Washington lies in the northwestern United States. On the north the state borders the Canadian province of British Columbia. Idaho is to the east, and Oregon is to the south. The Pacific Ocean lies to the west. Puget Sound is an arm of the Pacific that reaches into the state.

The greatest physical feature of Washington is the Cascade Range, or the Cascades. This mountain chain has the highest point in the state, Mount Rainier. It rises 14,410 feet (4,392 meters). The Cascades divide Washington into two parts. About one third of the state lies west of the Cascades. The area around Puget Sound is a lowland where more than half of the state's people live. Much of the land east of the Cascades is high, flat land called a plateau. The main river in Washington is the Columbia.

The climate in western Washington is wet and mild. Eastern Washington is much drier, with hot summers and cold winters.

People

During the 1800s many settlers came to Washington along the route called the Oregon Trail. Most of them were from the Midwest. Immigrants from Canada and northern Europe arrived later.

Today whites make up about four fifths of Washington's population. Hispanics and Asians are the largest minority groups. More than 90,000 Native Americans live in the state, too.

Economy

Washington's economy depends mostly on manufacturing and services. The Boeing Company makes aircraft and spacecraft in a huge factory near Seattle. The Microsoft Corporation, in Redmond, is a leader in the production of computer software. Service industries such as real estate and tourism grew quickly in the late 20th century.

The snowy peaks of Washington's Mount Rainier attract mountain climbers.

Other industries in Washington include the making of wood products and the processing of seafood and farm products. The main farm goods are apples, dairy products, and cattle. Fishing boats bring in salmon, crabs, and other seafood.

History

Native American tribes lived in the Washington region long before white settlers arrived. They included the Chinook, the Salish, and the Yakima. In 1792 both Great Britain and the United States claimed the region. The U.S. claim was strengthened in 1805, when the explorers Meriwether Lewis and William Clark arrived.

The region's early settlers made their living mainly by fur trading. Beginning in 1826 logging camps and sawmills were established. In 1846 Britain and the United States signed a treaty that set the border between Canada and the

United States. In 1853 the U.S. Congress established the Washington Territory north of the Columbia River. Washington became the 42nd state in 1889.

In the 1890s a gold rush in Alaska spurred the growth of cities and shipping ports on Puget Sound. Early in the 1900s Washington began projects to improve navigation and create power plants on the Columbia River. The Bonneville and Grand Coulee dams were built in the 1930s and 1940s.

In the second half of the 1900s the Seattle area became famous for the manufacture of airplanes and other high-technology products. Microsoft has been a major force in the state's economy since the 1980s.

Washington, Booker T.

Booker T. Washington was an educator who spoke for many African Americans during the late 1800s and early 1900s. Washington taught that hard work and patience were the best ways for them to improve their lives.

Booker Taliaferro Washington was born into slavery in Franklin County, Virginia, on April 5, 1856. Washington and his mother gained their freedom in 1865, after the end of the American Civil War. They moved to Malden, West Virginia. At age 9 Washington started working to help support the family.

Washington taught himself the alphabet and studied at a local school. He later attended the Hampton Normal and

Booker T. Washington

Agricultural Institute. After graduating in 1875 he became a teacher.

In 1881 Washington was selected to head a new school for African Americans in Alabama. The school was called the Tuskegee Normal and Industrial Institute. It had few students, only two buildings, and very little money. By 1915 Washington had built the institute into a university with about 1,500 students and almost 200 teachers.

During this time, although slavery had ended, African Americans still did not have the same rights that white people had. Washington wanted African Americans to win the respect of whites by learning farming skills and trades, such as brickmaking, mattress making, and wagon building. This, he said, would gradually break down the divisions between the two races.

Washington had many African American followers, but W.E.B. Du Bois and other leaders disagreed with him. These leaders believed that African Americans should protest and fight directly for more rights.

Many whites admired and honored Washington. He became one of the most powerful African American leaders of his time. Washington died in Tuskegee, Alabama, on November 14, 1915.

Did You Know?

Booker T. Washington told his own story in a famous book titled *Up from Slavery*.

Washington, D.C.

Population
(2000 census),
city, 572,059;
(2007
estimate),
588,292

The city of Washington is the capital of the United States, a country in North America. It was named after George Washington, the country's first president. He helped plan the city.

Washington is not part of a state. Rather, it is in a separate district called the District of Columbia. The city is thus known as Washington, D.C. The city and the district take up the same space.

Washington lies on the Potomac River. The state of Maryland surrounds the city on all other sides. The state of Virginia lies across the river from Washington to the southwest.

The U.S. Congress meets in a building called the Capitol. The Capitol sits on Capitol Hill in Washington, D.C.

Places of Interest

The most important U.S. government buildings are arranged around a broad lawn in Washington called the Mall. These buildings include the Capitol, where U.S. laws are made, and the White House, where the U.S. president lives. The city also has more than 300 monuments and statues. Among them are memorials honoring war veterans and former U.S. presidents George Washington, Abraham Lincoln, and Thomas Jefferson.

The Smithsonian Institution operates many large national museums in Washington. The city is also home to the world's largest library, the Library of Congress.

Economy

The economy of Washington depends heavily on government activity and tourism. The U.S. government is the largest employer. Many large national and international organizations also have headquarters in the city. Business services, research, law, health care, and other services are also important.

History

Washington is one of the world's few cities built to be a national capital. George Washington chose its location in 1790. An engineer named Pierre-Charles L'Enfant designed the city.

The U.S. government offices were moved to Washington in 1800. During the War of 1812 British troops burned

the White House and other buildings in Washington. They were rebuilt.

The population of Washington doubled after the American Civil War ended in 1865. Many freed slaves moved to the city. In the 1900s the city continued to grow.

In 2001 terrorists crashed airplanes into buildings outside Washington and in New York City. Many people were killed. After that the United States increased security around many government buildings.

Washington, George

George Washington led the American colonists to victory in the American Revolution. After the war he helped produce the U.S. Constitution. Finally, he served as the first president of the United States. Washington is often called the Father of His Country.

Early Life and Career

George Washington was born in Westmoreland County, Virginia, on February 22, 1732. He was the eldest child of Augustine and Mary Ball Washington. His father owned plantations, businesses, and mines. After his father died, George lived with his half brother Lawrence at an estate on the Potomac

George Washington was the first president of the United States.

River called Mount Vernon. George learned how to survey (measure) areas of land and to farm.

At age 16 Washington joined a group sent to survey the Virginia frontier. In 1749 he became the official surveyor of Culpeper County. After Lawrence's death in 1752, Washington became head of Mount Vernon and one of the richest planters in Virginia. Slaves did most of the work on his estate.

Beginning in 1754 Washington fought in the French and Indian War. He eventually became commander of all Virginia's troops. Washington also served in the House of Burgesses, Virginia's assembly of representatives. In 1759 he married Martha Dandridge, a widow with two children. The couple had no children together.

Washington leads the Continental Army into the American Revolution.

Washington heads the Constitutional Convention.

Washington retires to Mount Vernon.

American Revolution

Before the American Revolution Washington was loyal to Great Britain. By the late 1760s, however, he began protesting unfair British policies. In 1774 and 1775 Washington served in the Continental Congress. In April 1775 fighting between British and colonial troops began. The Continental Congress chose Washington to lead the colonial forces, called the Continental Army.

The fighting lasted for six difficult years. The army's lowest point was the winter of 1777–78, which it spent at Valley Forge, Pennsylvania. Many soldiers died from the cold, and more than 2,000 deserted. Washington held the army together, however, and continued fighting. Finally, in 1781, the British surrendered.

Presidency

In 1787 Washington served as president of the Constitutional Convention.

There, representatives designed the new U.S. government, laid out in a document called the Constitution. After the states accepted the Constitution, a group of men called electors chose Washington to be the country's first president. Washington took the oath of office in New York City on April 30, 1789. He was reelected in 1792. John Adams was his vice president.

Washington believed in a strong federal, or central, government. He also believed that the United States should remain neutral, or not take sides, in foreign affairs. Political parties developed because of his views. The Federalists, such as Alexander Hamilton, supported Washington's ideas. The Democratic-Republicans, such as Thomas Jefferson, defended the power of the states. Washington tried to keep a balance between the two parties.

Another problem faced by Washington was finding ways to pay the expenses of

the new government. Congress passed taxes on certain products, including whiskey. In 1794 farmers in Pennsylvania rebelled against the whiskey tax. Washington sent about 13,000 soldiers to end the rebellion. His actions showed the power of the federal government.

Retirement and Death

After eight years as president, Washington refused to run for a third term. He retired to Mount Vernon in March 1797. On December 14, 1799, he died of a throat infection. In 1800 the U.S. capital was moved from Philadelphia to the new city of Washington, D.C., named in honor of the first president.

Wasp

Wasps are insects related to bees and ants. There are more than 20,000 species, or types, of wasp. Yellow jacket and hornet are common names for several wasp species.

Wasps live on every continent except Antarctica. They are plentiful in tropical areas.

Wasps vary in color and size. Yellow jackets and hornets are black and yellow. Other wasps may have green, blue, or red markings. Some species measure up to 2.5 inches (6 centimeters) long. Others are among the world's smallest

A potter wasp constructs a nest out of mud.

insects. Wasps usually have two pairs of clear wings and six legs. Females often have a powerful stinger.

Some wasps live in groups called colonies. These insects are called social wasps. A female known as the queen starts the colony. She builds a paperlike nest and lays eggs in it. Her first batch of offspring gathers food and works to make the nest bigger.

Most types of wasp do not form colonies. They are known as solitary wasps. They may build nests in the ground, lay eggs inside plants, or even sneak their eggs into the nests of other insects.

Many people fear the sting of wasps. However, wasps usually sting only people who swat at them or touch their nest. In fact, wasps can be helpful. They feed many troublemaking insects to their young. They also help to spread pollen when they visit flowers to drink nectar. Spreading pollen allows flowers to make seeds.

Water

Water is the most important liquid on Earth. It covers almost 75 percent of Earth's surface in the form of oceans, rivers, and lakes. All plants and animals need water to live.

People have many uses for water besides drinking. They use it for washing and cooking. They use it to irrigate crops and lawns, to clean streets, and to operate air-conditioning units and heating systems. They also use the power of flowing water to produce electricity.

Makeup and Physical States

Water is made of tiny units called molecules, which are combinations of even smaller units called atoms. A molecule of water is made of two hydrogen atoms

Everyone should drink water every day. Water makes up about 60 percent of an adult's body by weight. Children's bodies have an even higher percentage of water.

River water gushes down rapids. Liquid water can flow freely. Water also occurs as a solid, called ice, and as a gas, called steam or water vapor.

and one oxygen atom. The scientific formula for water is H_2O .

Water can be found in three physical states: liquid, solid (ice), or gas (steam or vapor). The molecules in all three states are constantly moving. The speed of this movement determines water's physical state. In ice, the water molecules vibrate but basically stay in place. In liquid water, the molecules move more quickly but stay near each other. In vapor, the molecules move so quickly that they fly away in all directions.

Heat causes water to change from one physical state to another. When ice is heated, the water molecules move faster and farther apart. This causes the ice to melt into liquid. When liquid water is heated, the molecules speed up even more. Molecules at the surface of the liquid begin to break loose and fly into the air. In this way the liquid evaporates, or becomes vapor.

This process also works in reverse. Cooling temperatures slow down the molecules so that vapor turns back into liquid. Very cold temperatures turn liquid into ice.

Boiling and Freezing

Boiling is the formation of bubbles of vapor inside liquid. As water boils, the bubbles of vapor rise to the surface and escape into the air. At most places on Earth, freshwater boils when it reaches 212°F (100°C). Once it reaches this temperature, the water cannot get any hotter. Any heat added to the water just causes more water to evaporate.

Freezing is the transformation of liquid water into ice. Freshwater freezes at

32°F (0°C). Water is lighter as a solid than as a liquid. This is why ice floats and why it forms on top of a lake instead of at the bottom. Water also expands when it freezes. This is why water pipes can burst on very cold nights. The water inside the pipes pushes outward as it turns into ice.

The Water Cycle

Water on Earth is always moving. It moves from Earth's surface into the atmosphere and then returns to the surface. This movement is called the water cycle.

The sun, air, and gravity work together to create the water cycle. Heat from the sun causes water to evaporate from the

Most of Earth's water is in the oceans. But water is constantly being recycled. Through a process called evaporation, water moves from Earth's surface into the air as water vapor. The vapor can form clouds, which make rain and snow. Rain and snow bring water back to the ground again and into lakes, streams, and oceans. Some of the water seeps underground, where it is called groundwater.

surface of lakes, streams, oceans, and plants. The water vapor moves into the atmosphere. In the cool air high above the ground, the water vapor changes into droplets of water. Large groups of these droplets are called clouds. Gravity pulls the droplets back to Earth as rain. The rain falls into oceans and lakes, enters rivers, and seeps into the ground.

Waterfall

A waterfall is a place in a river where water spills suddenly downward. Waterfalls are known for their beauty and awesome power.

The world's tallest waterfall is Angel Falls, in Venezuela. Its water plunges 3,212 feet (979 meters). Angel Falls and other large waterfalls are sometimes called cataracts. Cataracts often drop straight down. The falling water may not even touch the rock behind it.

Smaller or less steep waterfalls may be called cascades. Cascades often fall over a number of short rock walls.

The action of flowing river water is one of the most common causes of waterfalls. Flowing water wears away the rock in a riverbed. Riverbeds sometimes contain areas of hard rock and areas of soft rock. In these cases the river wears away the soft rock before the hard rock. The hard rock that is left creates a steep wall.

Havasu Falls is a scenic waterfall in the Grand Canyon.

The river water plunges over the rock wall, forming a waterfall.

Waterfalls also form as a result of movements in Earth's crust. These movements can cause huge blocks of rock to rise or drop. This creates rock walls over which rivers may fall. Large, moving sheets of ice called glaciers also can cut away rock to form waterfalls.

Water Lily

Water lilies are plants that grow in still or slowly moving water. They like ponds, streams, and the edges of lakes in tropical and mild areas. Their floating leaves are often called lily pads. Frogs like to sit on them.

Did You Know?

Niagara Falls is the best-known waterfall in North America. It is partly in Canada and partly in the United States.

Water lilies grow from the muddy bottom of a body of water. Thick underwater stems are buried in the mud. Long stalks reach up from the stems to support the round, waxy leaves. Some leaves grow to 6 feet (2 meters) across. The leaves usually float on the surface, but sometimes they are underwater.

A single flower blooms at the end of each stalk. The flowers are shaped like stars or cups. They can be white, cream, pink, yellow, red, orange, purple, or blue. Some flowers open only in the morning. Others open only in the evening. For example, the Egyptian lotus has white flowers that bloom in the night and stay open only until midday.

Water lily plants also produce a fruit. It looks like a nut or a berry. Inside are seeds. When the fruit opens the seeds sink or float away to produce new plants.

Water lilies provide shade and hiding places for fish and other water animals. Fish, ducks, and other animals eat them,

too. Some people grow water lilies in garden ponds.

Weapon

A weapon is an object used to harm or kill living creatures or to destroy property. Individual people and armed forces use weapons to defend themselves or to attack an enemy. People also use weapons for hunting.

Early Weapons

The first weapons were things such as stones and wooden clubs. Early peoples used such objects to protect themselves and to hunt for food. Later, ancient people made weapons out of bronze and iron. They developed special swords, spears, and bows and arrows for warfare.

Ancient people also invented special weapons to get past the thick walls of cities and castles. Catapults were weapons that hurled objects over the walls. Battering rams were large wooden beams that could break down doors and walls.

During the Middle Ages (about AD 500 to 1500) Europeans began to use more complex and deadlier weapons. By the 900s they were using powerful crossbows that released arrows with a trigger. In the 1300s they developed large guns called cannons. These weapons were powered by gunpowder, an explosive mixture of chemical substances. (The Chinese had developed gunpowder hun-

Did You Know?

Poisonous chemicals and deadly germs can be made into weapons called chemical and biological weapons.

Water lilies bloom in the water. The plant's leaves float on top of the water.

The crossbow was a powerful weapon that could shoot a bolt (short arrow) as far as 1,000 feet (300 meters). At close range it could shoot through a knight's armor.

dreds of years before.) In a cannon, exploding gunpowder shot a heavy stone or metal ball out of a tube.

Modern Weapons

In the mid-1400s the Spanish invented the first gun that could be fired from a man's shoulder. It was called a *harquebus*. A larger shoulder gun, called a *musket*, replaced the *harquebus* in the 1500s. The first pistols, or handheld guns, also came into use at this time.

A powerful military rifle has two supports to hold it steady. A small telescope, or *scope*, helps the soldier to take aim.

Rifles came into wide use in the 1800s. Bullets shot from a rifle spin around as they travel. This makes shots fired from rifles very accurate. In the mid-1800s the first successful machine guns also began to be made. Machine guns could quickly fire many bullets in a row.

Armed forces used many deadly new weapons during World War I (1914–18) and World War II (1939–45). Some of these included tanks, poison gas, flamethrowers, and missiles (rockets that carry explosives to a target). Airplanes also played a major role in these wars because they could drop explosive weapons called bombs.

The deadliest weapon ever used was the atomic bomb, a kind of nuclear weapon. World War II ended after the United States dropped two atomic bombs on Japan. More than 100,000 Japanese people were killed.

Weapons Today

Today armed forces continue to use guns, missiles, bombs, and other modern weapons. Police officers in many countries carry clubs, handguns, rifles, or stun guns. (Stun guns use electrical shocks to stop people from moving.)

Weasel

Weasels are meat-eating mammals that are excellent hunters. They are closely related to mink, ferrets, and wolverines.

The stoat, or short-tailed weasel, has mostly brown fur in summer. In winter the fur may turn white.

Weasels live on every continent except Australia and Antarctica. There are about 10 species, or types, of weasel. The least weasel lives in Europe, Asia, and North America. The long-tailed weasel is common in North America and South America.

Weasels have very long, thin bodies. The neck is long and flexible. Weasels usually have brown fur. Some species turn white during winter.

Weasels are small animals. Not including its tail, the long-tailed weasel is about 10 to 12 inches long. It weighs 3 to 12 ounces (85 to 350 grams). The least weasel is the smallest living carnivore, or meat-eater. It weighs only 1 to 2.5 ounces (30 to 70 grams). The least weasel is about 6 to 8 inches (15 to 20 centimeters) long.

Weasels hunt alone at night. They move quietly and use scent to track their prey. They also have very good hearing. Weasels usually eat mice, rats, fish, and frogs.

Many weasels are valued for their skins and furs. Tail hair from some weasels is used to make paintbrushes.

Weather

Weather is the daily state of the atmosphere, or air, in any given place. It is different from climate. Climate is the average of weather conditions in an area over a long period.

Elements of Weather

Many different elements combine to create weather. Temperature is one of the basic elements of weather. Temperature is how warm or cold it is outside.

Wind, or the movement of air across Earth's surface, is a second element of weather. Winds may be gentle or very powerful.

A third element of weather is humidity, or the amount of moisture in the air. Warm air can hold more moisture than cold air can.

Precipitation is a fourth element of weather. Precipitation may come in many forms, including rain, hail, sleet, and snow. The form precipitation takes depends on other weather conditions, such as temperature.

A fifth element of weather is atmospheric pressure. This is the weight of air above a given area. Changes in pressure help people to predict approaching

Did You Know?

Scientists sometimes try to control weather. For example, they may add chemical particles to clouds in order to cause raindrops to form.

A meteorologist, or weather scientist, studies computer images of a hurricane. Meteorologists study satellite images of storms to find out how strong they are and which way they are headed.

storms. A storm is a disturbance in the atmosphere—for example, a thunderstorm or a hurricane.

Meteorology

Meteorology is the scientific study of weather. People who study and predict weather are called meteorologists.

Meteorologists use many instruments to gather information about weather. The thermometer and the barometer are two of the oldest and most common weather instruments. The thermometer measures temperature, and the barometer measures atmospheric pressure. Another common instrument is the wind vane, which shows the direction in which winds are blowing.

Today satellites in space collect weather information worldwide. Computers help meteorologists to track weather patterns and to make weather forecasts, or predictions.

Wells-Barnett, Ida B.

Ida B. Wells-Barnett was a writer and public speaker in the United States during the late 1800s and early 1900s. Her speeches and writings tell a shocking story of how whites killed African Americans in attacks called lynchings.

Early Life

Ida Bell Wells was born on July 16, 1862, in Holly Springs, Mississippi. Her parents were slaves. Wells's family gained their freedom after the American Civil War ended in 1865.

Wells was about 16 years old when both her parents died. Wells then looked after

Ida B. Wells-Barnett

the rest of her family. She taught school to earn money.

Career

As a young woman, Wells moved to Memphis, Tennessee. There she fought racial segregation—the forced separation of the races. In 1884 she refused to leave a railroad car that was reserved for whites. One of the railroad workers dragged her from the car. Wells began writing articles against segregation in African American newspapers. She soon became a part owner of a newspaper.

Wells started writing about lynching in 1892. White Southerners used lynching as a weapon of terrorism against African Americans. Mobs of whites would seize and murder African Americans, often by hanging. Police usually made no arrests. Wells wrote and spoke in public about lynchings so that people would know

what had really happened. She wanted people to become angry and put a stop to lynching.

Some whites disliked Wells's antilynching articles so much that they destroyed her newspaper office. Wells eventually moved to Chicago, Illinois, where she married Ferdinand L. Barnett in 1895.

Later Life

Besides fighting lynching, Wells-Barnett worked for women's right to vote. She also helped to found the National Association for the Advancement of Colored People. Wells-Barnett died in Chicago on March 25, 1931.

Western Australia

Western Australia is Australia's largest state. It covers nearly one third of the country. However, only about 10 percent of Australia's people live there. The

Formations of limestone thrust upward through the sand of the Pinnacles Desert in Western Australia.

state capital is Perth, a city on the southwestern coast.

Geography

Western Australia borders the Indian Ocean on the south, west, and northwest. The Timor Sea makes up its northern coast. The Northern Territory and the state of South Australia lie to the east. Western Australia covers an area of 976,790 square miles (2,529,875 square kilometers).

The Fitzroy and Ord rivers flow through the northern part of the state. South of the rivers is the Great Sandy Desert. Other deserts, the Gibson and the Great Victoria, cover the central part of the state. Mountains rise in parts of the west. Mount Meharry, in the northwest, is Western Australia's highest point. It rises 4,104 feet (1,251 meters) above sea level.

Several different climate areas are found in Western Australia. The northern section is warm throughout the year, with a

wet and a dry season. The southwest has cool, mild winters and warm, breezy summers. Hot, dry winds blow from the desert areas to the east.

People

Western Australia has a population of nearly 2 million. Most people have British, Irish, or other European ancestors. A small number of people have Asian roots. Australia's native people, called Aborigines, make up about 3 percent of the population.

Most people live in the southwestern quarter of the state. More than 1 million people live in Perth. Albany, a much smaller city on the southern coast, has the state's only good harbor. Other cities include Kalgoorlie-Boulder, Bunbury, and Geraldton.

Economy

Many Western Australians work in services such as education, health care, and retail (shops). A smaller number of people work in manufacturing. Workers produce steel, furniture, food products, and other goods.

Mining is also important to the economy. Western Australia is rich in valuable minerals, including gold, diamonds, nickel, iron, coal, tin, uranium, and bauxite. The state also has major deposits of oil and natural gas.

Western Australia has little freshwater and poor soil, so growing crops is hard. Farmers mainly produce grains, wool, and mutton (sheep meat). They also grow grapes for wine.

History

Aborigines have lived in what is now Western Australia for at least 40,000 years. In 1616 the Dutch explorer Dirck Hartog became the first European to land on the coast. The British made the first lasting settlement in 1826, at Albany. The British made the land a colony. They later sent thousands of prisoners to work in the colony.

In the 1880s people discovered gold in southern Western Australia, and settlers poured in. Western Australia became a state of the new country of Australia in 1901.

West Indies

The West Indies is a group of islands that stretches from near the U.S. state of Florida to the northern coast of South America. The islands separate the Caribbean Sea from the rest of the Atlantic Ocean. People also call this area the Caribbean.

Charlotte Amalie, on the island of Saint Thomas, is a port for tourist ships. The city is the capital of the U.S. Virgin Islands, in the West Indies. Tourism is important to the economies of many islands in the region.

Greater Antilles

A group of large islands in the northwestern Caribbean is known as the Greater Antilles. The Greater Antilles include Cuba, Puerto Rico, Jamaica, and Hispaniola. Two countries share the island of Hispaniola: Haiti and the Dominican Republic.

Lesser Antilles

The Lesser Antilles are smaller islands that lie southeast of the Greater Antilles. The northern Lesser Antilles are also known as the Leeward Islands. They include the British and U.S. Virgin Islands, Anguilla, Saint Martin, Saint Kitts and Nevis, Antigua and Barbuda, Montserrat, and Guadeloupe.

South of the Leewards are the Windward Islands. The Windward Islands include Dominica, Martinique, Saint

Lucia, Saint Vincent and the Grenadines, and Grenada.

Aruba, the Netherlands Antilles, and Trinidad and Tobago also belong to the Lesser Antilles. These islands are close to the coast of South America.

Other Islands

Several other islands lie outside the Antilles groups. The Bahamas are east and southeast of Florida. The Turks and Caicos Islands are southeast of The Bahamas. The Cayman Islands are northwest of Jamaica. Barbados lies east of the Windward Islands.

Foreign Ties

There are many independent countries in the West Indies. However, many other islands have ties to foreign countries. Puerto Rico and the U.S. Virgin Islands have ties to the United States. The British Virgin Islands, the Turks and Caicos Islands, the Cayman Islands, Anguilla, and Montserrat have ties to Great Britain. The Netherlands

The red-billed tropicbird is a seabird of the West Indies. The islands of the region have a rich variety of native birds, including parrots, hummingbirds, doves, and pigeons.

Antilles and Aruba have ties to The Netherlands. Guadeloupe and Martinique are parts of France. The Netherlands and France each control a part of Saint Martin.

History

Between 200,000 and several million Native Americans lived in the region before Europeans arrived in 1492. In that year Christopher Columbus landed on several islands in the West Indies. He probably landed first on an island in The Bahamas, then Cuba, and finally Hispaniola. Columbus thought he was in Asia, in the area now called the East Indies. Therefore, he called the people on the islands Indians.

Europeans soon controlled all of the West Indies. Haiti won independence from France in 1804. By 1902, the Dominican Republic and Cuba were independent, too. Most of the other countries in the West Indies gained independence in the second half of the 1900s.

West Nile Virus

West Nile is a virus that kills many types of birds. It also infects humans and other mammals. Most human infections

are mild, but some are deadly. For years West Nile virus was found mostly in the Middle East, Africa, and western Asia. In the 1990s it spread to Europe and the United States.

West Nile virus is spread from bird to bird through mosquito bites. Mosquitoes also carry the virus from birds to mammals. The virus does not pass from one person to another.

Only about one out of every five people infected with West Nile virus becomes ill. The symptoms, or signs, of illness start 3 to 14 days after infection. They include fever, headache, muscle aches, vomiting, and skin rash. These symptoms generally last a few days.

A small number of people infected with the virus become seriously ill. This mostly happens to people over the age of 50. In these people the virus reaches the brain, causing a condition called encephalitis. Symptoms of encephalitis include severe headache, high fever, neck stiffness, muscle weakness, and confusion. A person with encephalitis may become paralyzed or die.

There is no cure for infection with West Nile virus. The best way to keep from getting infected is to avoid being bitten by mosquitoes. Treatment focuses on relieving the symptoms. In severe cases people need to stay in a hospital for treatment.

Did You Know?

The first human case of West Nile virus was found in 1937 in the West Nile district of Uganda, a country in Africa.

West Virginia

The U.S. state of West Virginia was created during the American Civil War. In 1861 the state of Virginia voted to withdraw from the Union. But leaders from the state's northwestern counties rebelled and set up their own government. This division of Virginia lasted until June 20, 1863, when West Virginia became the 35th state of the Union.

West Virginia is nicknamed the Mountain State because of its rugged landscape. Charleston is the capital.

Geography

West Virginia is in the east-central part of the United States. It is bordered on the north by Pennsylvania and Maryland. Ohio and Kentucky lie to the west. Virginia is to the east and south.

Sandstone Falls are part of the New River Gorge National River in southern West Virginia. The river is part of the national park system.

All of West Virginia lies within the Appalachian Mountains. It is a state of forested hills and mountains separated by narrow valleys. The Allegheny Mountains, a section of the Appalachians, have the highest peaks. Many of them are more than 4,000 feet (1,200 meters) high. The Great Kanawha, Little Kanawha, Monongahela, and Shenandoah rivers cross the state.

West Virginia has a humid climate with warm summers and cold winters. The Alleghenies are the wettest part of the state. The mountains are often foggy.

People

The first European settlers in what is now West Virginia were Germans. Later came English and Scots-Irish settlers. In the late 1800s many European immigrants came to West Virginia to work in coal mines.

West Virginia's population today is about 95 percent white. African Americans are the largest minority group. They make up about 3 percent of the population.

Economy

Mining has been the traditional basis of West Virginia's economy. The state is rich in natural resources, including coal, natural gas, oil, and salt. But the mining industry decreased beginning in the late 1970s. Service industries, such as tourism, sales, and health care, helped the state's economy improve in the 1990s. Another boost to the economy was the transfer of government jobs to the state from Washington, D.C. Growth in the timber industry was important as well.

History

European explorers in the West Virginia region found Shawnee, Iroquois, and

Glass objects are on display at a museum in Huntington, West Virginia. The state has many glass-making factories because it has a great deal of sand, which is the main ingredient of glass.

Cherokee tribes already living there. In 1726 the first lasting European settlement was established in the northeast. The English controlled the region during the 1750s and 1760s. Though eastern Virginia was rapidly settled, the west's rugged land limited settlement there. After the American Revolution (1775–83), mostly nonslaveholding settlers moved west.

The Western part of Virginia was always different from the east. The land in the west was so mountainous that there were few plantations, or large farms, there. This meant that there was little need for slave labor. Eastern Virginia, however, had many plantations. Virginia broke away from the Union in 1861 to join the Confederacy with other slave states. Soon after that, the northwestern counties broke away from Virginia. In June 1863, while the American Civil War (1861–65) was being fought, these counties joined the Union as the new state of West Virginia.

After the Civil War, industry grew rapidly in the state. West Virginia's raw materials helped the growth of industry in other states as well. The state's population increased steadily up to 1950. After that, however, many people left West Virginia in search of jobs. Unemployment soared again in the 1980s, and almost one tenth of the population moved away. The population increased slightly by the year 2000.

Wetland

Marsh grasses grow in a saltwater marsh. Marshes and swamps can form in fresh-water or salt water.

Wetlands are areas where the land does not drain well. The ground in a wetland is saturated, or full of water. Often the ground is covered with shallow water.

Wetlands are usually classified as swamps, marshes, or bogs. The different types of wetlands have different kinds of soil and plants. Both swamps and marshes have soils that contain many minerals. They differ in their plant life. Most of the plants in swamps are trees, but marshes have grassy plants. Bogs differ from swamps and marshes because their soil has few minerals. Only mosses and a few other types of plants can grow in bogs.

Wetlands play a major role in the environment. They are home to a great vari-

ety of plants and animals. A wetland system can also protect shorelines, cleanse polluted waters, prevent floods, and restore underground water supplies.

Whale

Whales are large animals that live in water. Whales may look like fish, but they are mammals. They breathe air and produce milk for their young. Whales make up an order, or large group of animals, called Cetacea. The order includes dolphins and porpoises.

Toothed and Baleen Whales

There are two basic kinds of whale: toothed and baleen. Toothed whales have sharp teeth and eat mainly fish and squid. There are about 70 species, or types, of toothed whale. These include the sperm whale, the beluga, the killer whale, the narwhal, beaked whales, and

Humpback whales are very acrobatic. They often leap out of the water and then arch backward as they fall back down. They make a loud slapping sound when they hit the surface.

There are about 80 species, or types, of whale. The blue whale is the largest of all.

pilot whales. Dolphins and porpoises also belong to this group.

There are about 10 species of baleen whale. These include the blue whale, the gray whale, the fin whale, the humpback whale, the sei whale, and right whales. Baleen whales do not have teeth. A baleen whale feeds either by swimming with its mouth open or by gulping water. A series of filters in the mouth called baleen acts as a strainer. The baleen lets water out but holds in small fishes, shrimps, and other creatures.

Where Whales Live

Whales live in oceans and seas all over the world. Some species can be found in rivers. Large species often migrate, or travel from one place to another, at certain times of the year. Some types travel thousands of miles.

Physical Features

Whales are generally more than 10 feet (3 meters) long. Several species, mainly baleens, may be 60 feet (18 meters) long or more. The blue whale is the largest animal that has ever lived. It may be more than 100 feet (30 meters) long.

Whales are usually black, gray, black and white, or white. Some types are bluish gray. A whale's skin is smooth. A thick layer of fat, called blubber, beneath the skin protects the animal from cold water.

A whale's torpedo-shaped body helps it to move quickly through the water. It

pushes its tail up and down to move. The tail is divided into two broad sections called flukes. These extend horizontally (side to side) instead of vertically (up and down), as the fins of a fish do. A whale also uses two flippers on the front of its body for steering.

Whales go to the surface of the water to breathe. A whale takes in air through one or two openings, called blowholes, on the top of the head.

Behavior

Many kinds of whale, especially toothed whales often can be found in groups called schools or pods. These groups can range in size from a few animals to more than 1,000. Baleen whales are more likely to live alone or in small schools.

Whales make many sounds—including whistles, barks, and screams—to communicate with other whales. Toothed whales also make special sounds to locate objects they cannot see. These sounds bounce off solid surfaces and travel back to the whale's sensitive ears. This process is called echolocation.

Life Cycle

About one year after mating, a female whale gives birth to a single baby, or calf. She nurses her calf for a number of months. Some types of whale may live for 100 years or longer.

Did You Know?

For many years people hunted whales for the oil in their blubber. People used whale oil as fuel and to make soap. Today whale hunting is very limited.

Wheat

Wheat is a very important grain. It is a major source of nutrients for people. More of the world's farmland is devoted to wheat than to any other food crop. Wheat belongs to the grass family.

People first grew wheat as early as 9,000 years ago in the Middle East. Today China, India, and the United States are leading wheat producers.

There are thousands of kinds of wheat. Wheat plants grow to between 2 and 5 feet (0.6 and 1.5 meters) tall. Most types have a hollow stem. At the end of the stem is a structure called a head, or spike. The spike is made up of 20 to 100 tiny flowers. These flowers produce the seeds, or kernels, of wheat. Wheat kernels vary in color depending on the type of wheat. Some are dark reddish brown. Others are brown, tan, white, cream, or yellow.

Farmers harvest wheat using a machine called a combine. The combine cuts down the plants. Then it separates the seeds from the rest of the plants.

Most wheat is used to make food for people. Whole or coarsely chopped wheat kernels are cooked and used in cereals and soups. But wheat is more commonly used in the form of flour. To make flour, the kernels are cleaned and then crushed into tiny pieces. Wheat flour is used to make bread, cakes, crackers, cookies, and pasta.

Golden spikes of wheat are ready to harvest.

Wheat is also used to feed livestock. The dried plants are used as straw for animal beds.

Wheatley, Phillis

Phillis Wheatley was the first African American to write a book. Her book of poetry was published in 1773. Wheatley proved to many people that blacks were equal to whites in creative ability.

Phillis Wheatley was born in West Africa. Her date of birth and her African name are not known. A slave ship took her to Boston, Massachusetts, in 1761. She was then about 8 years old. A couple named John and Susanna Wheatley bought her. They gave her their own last name.

Wheatley quickly learned to speak, read, and write English. In 1767 a newspaper

A statue in Boston, Massachusetts, honors Phillis Wheatley.

published one of her poems. Three years later Wheatley wrote another poem to honor a clergyman named George Whitefield. The poem was published throughout the North American colonies and in England. Wheatley became famous.

By 1772 Wheatley had written enough poems to fill a book. Susanna Wheatley helped Phillis to publish the book in England. The book was called *Poems on Various Subjects, Religious and Moral*. Wheatley traveled to England in 1773. The English welcomed her as a famous author, though she was still a slave. Wheatley gained her freedom when she returned from England.

Some of Wheatley's poems could not be published in England because they supported American independence. Her

most famous patriotic poem is *To His Excellency, General Washington*.

In 1778 Wheatley married John Peters, a free black man. She had three children with him. Wheatley was working as a servant when she died on December 5, 1784.

Whippoorwill

The whippoorwill is a North American bird that is nocturnal, or active at night. It is named for its call—three whistled notes that sound like “whip-poor-will.” It may repeat this call 400 times without stopping.

Whippoorwill is in the same scientific family as nightjars and nighthawks. They are also related to owls. The scientific name of the whippoorwill is *Caprimulgus vociferus*.

Whippoorwill live in woodlands. They can be found in southeastern Canada, in the eastern and southwestern United States, and in Mexico. They may spend the winter as far south as Costa Rica.

The whippoorwill is about 9.5 inches (24 centimeters) long. It has spotted brownish and grayish feathers. The bird has very short legs and large eyes. Its bill is small, but its mouth can open very wide. The corners of the male's tail are white. The male also has a thin band of white feathers around the neck.

A whippoorwill rests on a log. The bird's color helps it blend in well with the wood.

Around dawn and dusk the whippoorwill swoops across the sky, searching for insects to eat. By day it sleeps on the forest floor or perches lengthwise on a branch.

White House

The president of the United States lives and works in the White House. The president's family lives there also. The White House is in Washington, D.C., at 1600 Pennsylvania Avenue N.W. Its walls are made of sandstone and painted white.

Layout

The president uses part of the White House for social events. The biggest room, called the East Room, is where dances and large gatherings take place. The State Dining Room is only slightly smaller. As many as 140 people can sit down to eat there. The Red, Blue, and Green rooms are named for the colors

that were used to decorate them. All these rooms are on the first floor.

The second and third floors contain private living space for the president, the president's family, and the president's guests. The family and guests can enjoy the White House's movie theater, swimming pool, tennis court, jogging track, and library. In addition, the White House has its own doctor's office, dentist's office, and barber shop.

The West and East wings of the White House connect with the main building. They contain offices for government workers. The office of the president—called the Oval Office—is in the West Wing. The office of the vice president is also in the West Wing. The East Wing holds other offices, including those of the first lady (the president's wife) and her staff.

History

The first president of the United States—George Washington—did not

The White House is the official residence of the president of the United States. It is one of the best-known sites in the U.S. capital, Washington, D.C.

The Green Room is one of the public rooms on the first floor of the White House.

live in the White House. It had not been built yet, and Washington, D.C., did not exist when he was elected. The capital at the time was New York City. During Washington's first term the capital was moved to Philadelphia. In 1790 the U.S. Congress chose the area that is now Washington, D.C., to be the site of the new permanent U.S. capital. In 1792 an architect named James Hoban drew up plans for a house where the president could live. The house was not ready until 1800. John Adams was the first president to live there.

In 1814, during the War of 1812, British soldiers entered Washington, D.C. They set a fire that damaged the inside of the White House. Workers finished making repairs in 1817.

In 1902 workers built the West Wing to make office space. In 1942 workers built

the East Wing to make even more space. From 1948 to 1952 much of the interior of the building was rebuilt. The outside walls were not changed. Over the years several presidents and their wives have redecorated the rooms of the White House. Today the public can tour parts of the main building.

War of 1812 • Washington, D.C.

Whitney, Eli

Eli Whitney was one of the first great inventors in the United States. He invented the cotton gin, which helped to make cotton the most important crop of the Southern states. He also invented methods of producing many goods quickly and cheaply. Factories still use these methods, called mass production, today.

Eli Whitney was born in Westboro, Massachusetts, on December 8, 1765. He graduated from Yale College in 1792. He then moved south to Georgia.

Many farmers in Georgia grew cotton. Whitney found out that they had no easy way to separate cottonseeds from cotton fiber so that the cotton could be used. Whitney solved the problem by inventing a machine called the cotton gin (short for "engine"). The cotton gin was an immediate success. Farmers were able to produce far more cotton each year. Between 1793 and 1800, U.S. cotton production rose from about 3,000 bales (bundles) a year to 73,000 bales a year.

Eli Whitney invented a machine called a cotton gin in 1793. The machine had a set of wire spikes set on a revolving cylinder, or drum. As the cylinder turned around it pulled raw cotton through the spikes. The spikes combed the seeds from the cotton and left the fibers.

Whitney also had ideas about how to make things in factories. He first used these ideas to make guns for the U.S. government. Before his time, one skilled worker made all the parts of a gun by hand and then fitted them together. Whitney used machines to make many copies of each part. He then hired unskilled workers to put the parts together. Whitney's factory made guns faster and more cheaply than ever before. His ideas changed the way factories made all kinds of products. Whitney died in New Haven, Connecticut, on January 8, 1825.

Wichita

The Wichita are Native Americans of Oklahoma. They once lived in what is now Kansas. The city of Wichita, the

largest city in Kansas, was named after the tribe.

The Wichita traditionally grew corn, pumpkins, beans, squash, and tobacco. They also hunted deer, antelope, bear, and bison (buffalo). The Wichita lived in round houses that looked like haystacks. They built their homes by covering a wood frame with grass. While hunting the Wichita lived in cone-shaped tents called tepees, which they carried from place to place. They made the tepees with animal skins.

Spanish explorers arrived in Wichita lands in the middle of the 1500s. At that time the Wichita lived near the Arkansas River in what is now Kansas. By the early 1700s they had moved south to Indian Territory (now Oklahoma). French explorers met the tribe there. The Wichita became allies and trading partners of the French.

A photograph from the 1870s shows a Wichita man named Esadewar.

In the late 1700s war with the Osage Indians forced the Wichita to move farther south, into what is now Texas. During the American Civil War (1861–65) the Wichita returned to Kansas. In 1867 they moved to a reservation in Indian Territory. At the end of the 20th century there were about 1,500 Wichita living in the United States, mostly in Oklahoma.

Wilder, Laura Ingalls

Laura Ingalls Wilder

Laura Ingalls Wilder wrote children's books about pioneer life in the United States. She based her famous "Little House" stories on her own childhood on the American frontier.

Laura Elizabeth Ingalls was born on February 7, 1867, in Pepin, Wisconsin. She had three sisters. During her child-

hood she and her family moved often from one part of the frontier to another. They lived in Minnesota, Iowa, Missouri, Kansas, Indian Territory (now Oklahoma), and Dakota Territory (now North and South Dakota).

At age 15 Laura began teaching in country schools to help support the family. In 1885 she married Almanzo J. Wilder.

While in her 40s Wilder began writing articles for magazines. The Wilders' only daughter, Rose, liked hearing stories about her mother's youth. When Rose became an adult, she asked her mother to write down her tales of growing up on the frontier. From 1932 to 1943 Ingalls published six books in the "Little House" series. They included *Little House in the Big Woods* and *Little House on the Prairie*.

Wilder died in Mansfield, Missouri, on February 10, 1957. The American Library Association honored her in 1954 by creating the Laura Ingalls Wilder Medal. The award is given to outstanding writers and illustrators of children's books.

Williams, Venus and Serena

Venus and Serena Williams are sisters who play tennis. They won many important tournaments from 1999 to the early 2000s. The two sometimes

Serena (left) and Venus Williams show the trophies they won at the 2001 U.S. Open tennis tournament.

teamed up to win doubles (two against two) championships. Each sister won several singles championships as well. In 2002 they were the top two women tennis players in the world.

Venus Williams was born on June 17, 1980, in Lynwood, California. Serena was born on September 26, 1981, in Saginaw, Michigan. The sisters' father, Richard, taught them to play tennis when they were very young.

The Williams sisters both became professional tennis players at about age 14. Being professional means that they earned money for playing. In 1999 Serena won the U.S. Open, a major tennis tournament.

In 2000 Venus won another of the major tournaments, this one in Wimble-

don, England. She and Serena won the women's doubles competition at Wimbledon as well. Later that year Venus won the U.S. Open for the first time. She and Serena won the gold medal for doubles at the 2000 Olympics. In 2001 Venus won both Wimbledon and the U.S. Open again.

In 2002 Serena beat her sister at the French Open, Wimbledon, and the U.S. Open. She became the number-one player in the world. In 2003 Serena beat Venus at Wimbledon and the Australian Open. The Australian Open victory gave her wins in all four of the major tournaments. Both sisters won many more titles after that. They won their second doubles gold medal at the 2008 Olympic Games.

Willow

The name willow applies to a wide variety of shrubs and trees. There are more than 300 species, or types, of willow. One of the most familiar is the weeping willow. This large tree has drooping branches and twigs. The pussy willow is another member of the willow family. It is a bush that has silvery white, furry buds on its branches in the spring.

Willows grow in North and South America, Europe, and Asia in generally cool areas. Most grow near rivers, lakes, or swamps. Willow trees have tough, deep roots. They help to keep the soil of the coastline from washing away.

Did You Know?

The furry buds of a pussy willow are called catkins. Catkins are clusters of tiny flowers. All willows grow catkins.

The weeping willow tree is usually found near water.

Willows vary greatly in size and shape. They may be low shrubs that grow just a few inches above the soil. Some are large trees that reach more than 100 feet (30 meters) in height. The bark may be gray, brown, or nearly black. The leaves are narrow and green. On some trees the twigs are bright yellow, orange, or red.

Willow wood is used to make products such as tool handles, baseball bats, and furniture. A substance in some willow bark is also used to make pain medicine.

Wilson, Woodrow

Elected in 1912, Woodrow Wilson was the 28th president of the United States. He led the country through World War I. Afterward he helped create the League

of Nations, an international peace organization.

Early Life and Career

Thomas Woodrow Wilson was born on December 28, 1856, in Staunton, Virginia. His parents were Joseph Ruggles Wilson, a Presbyterian minister, and Janet Woodrow. The Wilsons moved to Augusta, Georgia, after their son's birth.

Wilson graduated from Princeton University in 1879. In 1886 he earned an advanced degree in government and history from Johns Hopkins University. Four years later Wilson returned to Princeton as a professor. In 1902 he became president of Princeton.

In 1885 Wilson married Ellen Louise Axson. They had three daughters. Ellen died in 1914. Wilson married Edith Bolling Galt in 1915.

Woodrow Wilson was the 28th president of the United States.

TIMELINE

Wilson is born in Staunton, Virginia.

December 28, 1856

Wilson is elected president.

1912

Wilson is elected governor of New Jersey.

1910

1917

The United States enters World War I.

World War I ends.

1918

Wilson retires from office.

1921

Wilson dies in Washington, D.C.

February 3, 1924

Political Career

In 1910 Wilson was elected governor of New Jersey. In 1912 the Democratic Party chose him to run for president. Wilson faced two opponents in the election: President William Howard Taft and former president Theodore Roosevelt. Wilson won the election.

Presidency

Wilson successfully pushed Congress to pass a number of laws. One law introduced an income tax. Another law created the Federal Reserve System, a powerful economic agency. Other laws regulated business and stopped child labor.

In foreign affairs, revolution in Mexico caused problems for Wilson. In 1916 the Mexican rebel Pancho Villa crossed the border and killed about 17 people in New Mexico. Wilson sent U.S. forces into Mexico, but they failed to catch Villa.

World War I

In 1914 World War I began in Europe. Wilson kept the United States neutral, meaning it did not take sides. After winning reelection in 1916, Wilson tried to end the war through peace talks. In early 1917, however, German submarines began attacking neutral ships. In April Wilson asked Congress to declare war.

In May 1917 Congress passed the Selective Service Act, which gave the government the right to order U.S. citizens to join the military. The 2 million U.S. soldiers sent to France helped defeat the Germans. The war ended on November 11, 1918.

Making Peace

Wilson attended the peace conference in Paris, France, after the war. He hoped to include his Fourteen Points, or 14 ideas for peace, in the agreement. The Treaty of Versailles, signed in 1919, left out many of Wilson's ideas. However, it

included the League of Nations, an organization to maintain world peace.

When Wilson presented the treaty to Congress, Republicans rejected it. They especially opposed the League of Nations. The league held its first meeting in 1920 without the United States.

Later Years

Working on the treaty left Wilson exhausted. He had a medical emergency called a stroke in October 1919, but he stayed in office until March 1921. He died in Washington, D.C., on February 3, 1924.

Wind

Wind is the movement of air near Earth's surface. Wind can be a gentle

A strong winter wind blows snow and bends trees.

breeze or a strong gale. The most powerful wind happens during storms called tornadoes, cyclones, and hurricanes.

Changes in the temperature of air, land, and water cause wind. When air flows over a warm surface, it heats up and rises. This leaves room for cooler air to flow in. The flowing air is wind.

Winds are named after the direction from which they come, not the direction toward which they blow. For example, wind blowing from west to east is called a westerly.

Winds greatly affect the weather. They bring cool air into warm areas. They also can bring rain, snow, or even dust and sand. For example, in southern Asia winds known as monsoons bring rain during the summer. This happens because cool, moist air from over the ocean moves in over the warm land.

Large movements of air around Earth are called planetary winds. Some of the best-known planetary winds are the tropical easterlies, or trade winds. The trade winds are two large belts of wind on either side of the equator. They blow steadily toward the west.

Since early times people have harnessed the power of wind. Early sailors relied on the planetary winds to travel across oceans. Early peoples also built windmills, or machines that used wind power to turn stones or other machines to grind grain. Today people use

windmills to power machines that create electricity.

Windhoek

Population
(2001 estimate)
216,000

Windhoek is the capital of Namibia, a country in southern Africa. It is Namibia's largest city by far. A ring of hills surrounds the city.

The economy of Windhoek is very important to Namibia. Windhoek is the country's main center of trade, banking, industry, and transportation. Factories in the city make such products as cloth, clothing, leather goods, and processed foods.

The first settlers in what is now Windhoek were the Khoekhoe and Herero peoples. The town was once called Aigams, meaning "hot water." The name referred to the region's natural hot springs, where steaming-hot water spouts from the ground. Europeans later changed the name to Windhoek.

Germany took over the town in the late 1800s. South Africa took control of

German colonists designed some of the buildings of Windhoek, Namibia, to look like buildings in Germany. Modern buildings now rise nearby.

Windhoek and the rest of Namibia in 1915. In 1990 Namibia became an independent country with Windhoek as its capital.

Windmill

A windmill is a machine that harnesses the power of the wind. Windmills may be used to grind grain into flour, to pump water, or to produce electricity.

A windmill has a number of blades that spin around when wind blows on them. The blades are mounted on a tall tower or building. They are connected to a vertical shaft, or rod. When the blades spin, they turn the shaft. The turning shaft powers a device that does work—for example, a water pump or millstones, which grind grain. The shaft also may provide power to a machine called a generator, which produces electricity.

Windmills on a hillside in California are used to generate electricity.

People in western Asia built the earliest known windmills more than 1,000 years ago. They used these windmills to grind grain. Windmills spread to Europe by the 1100s. The Dutch used them to pump water out of low-lying areas near the sea. By the 1800s, however, many people used steam engines rather than wind power to run mills and to do other work. Today modern windmills, called wind turbines, produce electricity for many communities.

Winnebago

The Winnebago are Native Americans of the midwestern United States. They call themselves Ho-Chunk, which means “people of the first voice.”

The Winnebago traditionally lived in dome-shaped homes called wigwams. They made their wigwams by covering a wood frame with bark. The Winnebago grew corn, squash, and beans. They hunted small animals in the forest. They

also traveled to the prairies to the southwest to hunt bison (buffalo).

The Winnebago knew only other Native Americans until 1634. In that year French explorers arrived in their lands near Green Bay, in what is now eastern Wisconsin. The Winnebago traded with the French for such goods as metal pots and guns. But many Winnebago died from diseases brought by the French, especially smallpox.

By the early 1800s the Winnebago had spread into southwestern Wisconsin and

A Winnebago of Wisconsin weaves a basket in the early 1900s.

northwestern Illinois. In the 1820s and 1830s the U.S. government forced the Winnebago to give up all their land east of the Mississippi River. The government moved the tribe first to Iowa, then to Minnesota, and then to South Dakota. Hundreds of Winnebago died during the moves.

In 1865 about 1,200 Winnebago finally settled on a reservation in Nebraska. In the 1880s half of the tribe returned to Wisconsin. At the end of the 20th century there were about 7,500 Winnebago in the United States. Most still lived in Nebraska or Wisconsin.

Native Americans

Winnemucca, Sarah

Sarah Winnemucca was a Native American speaker and writer. She worked throughout her life to improve the lives of her people, the Paiute. As a writer, she is best known for her book *Life Among the Piutes*, published in 1883.

Sarah Winnemucca was born in about 1844 in what is now Nevada. Her original name was Thocmetony, which means “shell flower.” She was the daughter of a Paiute leader named Old Winnemucca. During Sarah’s childhood white people moved onto Paiute lands.

By age 14 Winnemucca could speak English, Spanish, and several Native American languages. Eventually the U.S.

Sarah Winnemucca

government asked her to be an interpreter between white settlers and Native Americans. An interpreter helps people who do not speak each other’s language to communicate.

During the 1870s the U.S. government forced many of the Paiute to move long distances to reservations (lands set aside for them). In 1879 Winnemucca went to San Francisco, California, to speak out about how her people had been wronged. In the 1880s she gave more speeches in the eastern United States.

As Winnemucca’s fame grew, President Rutherford B. Hayes and other government leaders met with her. They promised to give some land back to the Paiute. However, they did not keep their promises. Winnemucca died on October 16, 1891.

Wisconsin

Wisconsin has long been noted for its lakes, rivers, and beautiful rolling hills. The state was named for its main river, the Wisconsin. The name is believed to have come from a Native American word meaning “gathering of waters.” Wisconsin is also known as a center of the dairy industry. The slogan on Wisconsin’s license plates is “America’s Dairyland.” Madison is the state capital.

Geography

Wisconsin is located in the north-central part of the United States. In the north Wisconsin borders Lake Superior and the Upper Peninsula of Michigan. Lake Michigan lies to the east, and Illinois is to the south. The Mississippi and Saint

Croix rivers form most of Wisconsin’s western border with Minnesota and Iowa.

The northernmost part of Wisconsin, along Lake Superior, is a narrow plain. But most of the northern part of the state is a highland region with many lakes. To the south is a plain that stretches across the center of the state. The southwest is a region of ridges and valleys. Wisconsin has long, cold winters and warm summers.

People

In the early 1800s white settlers came to the Wisconsin area from other parts of the United States. In later years immigrants came from Germany, Poland, Scandinavia, and other parts of Europe. The majority of Wisconsin’s people are descendants of these settlers. African Americans are the largest minority group, making up about 6 percent of the population. Hispanics represent almost 4 percent of the population.

Economy

Wisconsin is known as America’s Dairyland because the state has long been a leading producer of milk, butter, and cheese. The state is famous for its cheddar cheese, but it also produces Swiss, Colby, and many other varieties.

Manufacturing and services are Wisconsin’s major sources of income. Many of the state’s factories produce industrial

Cheesemakers work on a large vat of cheese at a plant in Wisconsin. Wisconsin is known for its cheese and other dairy products.

machinery. Others make metal and paper products. The processing of food and the brewing of beer are also major industries.

Service industries such as health care, real estate, and tourism were the fastest-growing part of the state's economy in the late 20th century. Tourism provides more than 300,000 jobs to Wisconsinites. Tourists spend about 9 billion dol-

lars in Wisconsin each year. One popular tourist attraction is Wisconsin Dells, which is famous for its riverside cliffs, sandstone formations, and family vacation spots.

History

Several Native American tribes lived in the Wisconsin area when Europeans arrived. Among them were the Ojibwa (or Chippewa), Potawatomi, and Winnebago (Ho-Chunk).

The French explorer Jean Nicolet landed on the shores of Green Bay in 1634. In 1763, after many wars, France was forced to give the region to Great Britain. After losing the American Revolution (1775–83), Britain gave the land to the United States.

Settlement of Wisconsin was slow until immigrants began arriving from northern Europe in the 1830s. The U.S. Congress made Wisconsin a territory in 1836. In 1848 Wisconsin became the 30th state.

In the second half of the 1800s wheat farming, lumbering, and dairying were Wisconsin's main economic activities. Wheat farming and lumbering eventually became less valuable. In the early 1900s Wisconsin became the country's leading dairy state. Later in the 1900s manufacturing and service industries became important to the state's economy.

Wolf

Wolves are members of the dog family. They are known for their intelligence and courage. Wolves are also noted for traveling very long distances. North American Indians named their most powerful warriors after wolves.

Where Wolves Live

There are three species, or types, of wolf. The best known is the gray wolf. It lives in North America, Europe, and Asia. The red wolf once lived throughout the southeastern United States. Now most red wolves live in captivity. Some can still be found in the wild in North Carolina. The Ethiopian wolf was once considered a jackal. Many people now believe it is a wolf. It lives in Ethiopia.

Physical Features

The gray, or timber, wolf has long legs and large feet. The males are larger than the females. A male gray wolf usually

Gray wolf, or timber wolf

weighs about 100 pounds (45 kilograms). Including the tail, it may be about 6.5 feet (2 meters) long. The gray wolf's fur is usually gray. It may also be brown, red, white, or black. The legs and belly are yellowish white.

The red wolf weighs 44 to 82 pounds (20 to 37 kilograms). Its coat is reddish brown or sandy colored. The Ethiopian wolf also has reddish brown fur. A male Ethiopian wolf weighs only about 35 pounds (16 kilograms).

Behavior

Wolves are social animals. They live in groups called packs. A wolf pack usually has a pair of adult wolves and their offspring. The male and female leaders are known as the alpha pair. Wolves normally hunt at night in groups. They eat deer, moose, squirrels, and mice.

Survival

All species of wolf are in danger of dying out. This is partly because their habitats are being destroyed. People also kill wolves because the wolves attack cattle. Today there are many programs to protect wolves.

Wolof Empire

The Wolof Empire was an African state that was powerful from about 1200 to the 1550s. The empire covered parts of what is now Senegal, in western Africa.

A king called a *burba* ruled the empire. He also served as the empire's religious leader.

The Wolof people came from what is now the country of Mali in the 1000s. They set up a kingdom soon after 1200. During the 1300s Wolof took over neighboring kingdoms. One of these kingdoms, called Cayor, controlled lands along the coast of the Atlantic Ocean. By the 1400s Wolof had become a powerful empire.

In about 1440 Portuguese traders came to the area. They traded many goods with the Wolof Empire. They also tried to take control of the Wolof people. But the Wolof kept their independence.

In 1556 the Cayor people became independent of the Wolof Empire. They set up a state of their own on the coast. This weakened the Wolof because now they had no way to reach the ocean. As a

result the Wolof were cut off from trade with Europeans.

Over the next 300 years Europeans set up more trading centers along the coast. The power of the Wolof shrank further. During the 1800s the French settled in the Wolof lands and fought the Wolof people. In 1895 the Wolof lands became part of a colony of France.

Wolverine

The wolverine is a mammal of the weasel family. Like its relative the skunk, the wolverine can give off an unpleasant smell. It is sometimes called a skunk bear. Its scientific name is *Gulo gulo*.

The wolverine is found mostly in the northern parts of North America, Europe, and Asia. It is known for its great strength and big appetite.

The wolverine looks like a small, thick-bodied bear. It ranges from about 26 to

The wolverine is a strong animal. It has a thick neck and big claws.

Did You Know?

The scientific name for the wolverine means "glutton," or "big eater," in the Latin language.

36 inches (66 to 91 centimeters) in length and has a long, bushy tail. It can weigh from 20 to 66 pounds (9 to 30 kilograms). The wolverine has short legs and ears, strong teeth, and sharp claws. The thick coat is blackish brown. A light brown stripe runs from each side of the neck down to where the tail starts.

The wolverine lives alone and is usually active at night. It can travel up to 40 miles (64 kilometers) a day looking for food. The wolverine eats small animals that it kills and larger animals that it finds dead. Some wolverines will attack large animals such as sheep and deer. The wolverine has no enemies except for people.

Women's Rights

In many countries today women have the same rights as men. They have the right to own property. They have the right to get an education. They have the right to work at any job they choose. They have the right to vote. They have the right to be elected president or prime minister of their country. But it has not always been this way. Women called feminists worked for many years to get these rights.

Early Ideas About Women

Through much of history, women have not been treated as equals with men. Women were thought to be naturally weaker and less smart than men. Some

A British poster from the early 1900s backs voting rights for women.

myths and religions even presented women as a source of evil.

For all these reasons, women were not given the same rights as men. But when women were given some freedom, they made important achievements. For example, some women became powerful leaders. Queen Elizabeth I ruled England for 45 years in the 1500s. Catherine the Great was empress of Russia in the 1700s.

In the late 1700s many people in Europe and North America began to speak of individual freedom. They said that people had rights that governments must respect. But they used such phrases as "the rights of man," which some people thought did not include women. During this time some free-thinking women spoke up for women's rights. One of them was the English feminist Mary

Wollstonecraft. She said that women should receive the same opportunities as men in education, work, and politics.

The Right to Vote

Women knew that if they were going to change society they must win suffrage, or the right to vote. In this way they could take part in government. Then they could influence policies and laws.

The United States

In the United States the women's rights movement grew out of the abolitionist, or antislavery, movement. Lucretia Mott and Elizabeth Cady Stanton were abolitionists who also led the first women's rights convention. It was held in Seneca Falls, New York, in 1848.

Stanton and Susan B. Anthony formed the National Woman Suffrage Association in 1869. Lucy Stone formed the American Woman Suffrage Association in the same year. The two groups united in 1890.

The struggle to win the vote was slow. Starting in 1869, some territories and states gave women the vote. But efforts to create a federal law failed again and again. Victory finally came in 1920, when the 19th Amendment to the U.S. Constitution was passed. It gave women the right to vote nationwide.

Around the World

Women in other countries also worked for voting rights. Women gained the vote in New Zealand in 1893, in Australia in 1902, in Finland in 1906, and in Norway in 1913.

In the United Kingdom, Emmeline Pankhurst got women to march in the streets for voting rights. In 1918 British women over age 30 won the vote. In 1928 the age was lowered to 21.

Other countries changed more slowly. Women in Switzerland could not vote until 1971. Even in the 21st century women in some Middle Eastern countries still did not have the right to vote.

The Modern Women's Movement

A new women's rights movement began in the 1960s. This movement was commonly called "feminism" or "women's liberation." Feminists in the United States formed the National Organization for Women (NOW) in 1966.

NOW worked to make the Equal Rights Amendment (ERA) a part of the U.S. Constitution. The amendment would have guaranteed all legal rights, not just

People gather in the late 20th century to demand equal pay for women workers in the United States. The Equal Pay Act of 1963 said that men and women should get equal pay for equal work.

In 1999 Helen Clark became the first woman to be elected prime minister of New Zealand.

voting rights, to women. It died in 1982 because not enough states ratified, or approved, it.

But the women's rights movement still made gains. For example, it helped make birth control available to more women. Birth control gives women greater control over when they have children. Birth control allowed more women to have careers.

Women who chose careers at first faced much unfairness in the workplace. Congress passed laws to help them. The Equal Pay Act of 1963 said that men and women had to get the same pay for doing the same job. The Civil Rights Act of 1964 included equal rights for women as well as for racial minorities. The act made it illegal to set aside some jobs for men and others for women.

Education also became more available to women. By the end of the 20th century

women were earning more than half of all college degrees in the United States.

Many women were elected to government offices, too. Women served as president or prime minister in India, Ireland, Israel, New Zealand, Pakistan, Sri Lanka, the United Kingdom, and many other countries.

Woodpecker

The birds called woodpeckers are known for pecking holes in tree bark to find

A great spotted woodpecker feeds its young. Great spotted woodpeckers live in Europe, Asia, and North Africa.

insects to eat. Most woodpeckers live in forests, spending their lives mainly in trees.

There are about 180 species, or types, of woodpecker. They include the birds called flickers and sapsuckers. Woodpeckers look like songbirds in many ways. But scientists classify woodpeckers in a different grouping, the order Piciformes. They are related to toucans.

Woodpeckers live nearly all over the world. They are most common in South America and Southeast Asia.

Woodpeckers vary in length from about 6 to 18 inches (15 to 46 centimeters). They are often black and white with patches of red or yellow on the head.

Most woodpeckers fly with short swoops. Each of their feet has two toes pointing forward and two toes pointing backward. This helps the birds cling to tree trunks. The strong, rigid tail feathers help the bird hold itself against the tree. The long, sticky tongue helps the bird trap insects.

Most woodpeckers eat insects found in tree bark. The bird uses its bill to tap holes into the bark. This normally does not hurt the trees. In fact, woodpeckers eat insects that are harmful to trees. Some kinds also eat fruit. Sapsuckers also feed on sap, a liquid made by trees. Flickers eat mainly ants on the ground.

Woodpeckers are usually silent, except in spring. Then males call loudly and

drum on hollow wood or even metal. This warns other males to stay away.

Woods, Tiger

Tiger Woods watches the golf ball he has just hit as it moves closer and closer to the hole.

The U.S. golfer Tiger Woods achieved outstanding success at his sport. He began winning golf championships at a very young age. He was just 21 when he first won the Masters Tournament, in 1997.

Woods was born on December 30, 1975, in Cypress, California. His father was African American, and his mother was from Thailand. His first name is Eldrick. His father gave him the nickname Tiger.

Woods first picked up a golf club at the age of 18 months. He won more than

30 junior tournaments before becoming a teenager. At age 15, Woods won his first of three U.S. Junior Amateur titles. He then won three U.S. Men's Amateur titles.

Woods went to college at Stanford University in California. While he was there he became the national college champion. Soon afterward he decided to become a professional (paid) golfer.

The four most important golf tournaments are the Masters, the Professional Golfers' Association (PGA) championship, the U.S. Open, and the British Open. Winning all four during one's career is known as a Grand Slam. In 2000 Woods became only the fifth player in golf history to complete a Grand Slam. At age 24, he was also the youngest.

Because he was so successful, several companies paid Woods to advertise their products. He used some of this money to form a charity to help children.

World Music

The term world music describes types of music that come from places other than the United States or Great Britain.

Therefore, the singers of world music often do not sing in English. But world music is not just one style of music. Different types of music from Africa, Asia,

African musician Youssou N'Dour, from Senegal, sings at the Montreux Jazz Festival in Switzerland.

South America, the Caribbean islands, and Europe all can be called world music.

The first popular examples of world music came from Africa in the 1980s. One of the early African world music stars was King Sunny Ade, from Nigeria. He led a large band that included guitars, drums, and singers. The style was new to people outside Africa, and his records sold well.

Record companies soon began selling more and more world music. Fans liked it because it was different from other styles of popular music. It allowed them to hear music from cultures very different from their own. Some U.S. rock musicians, including David Byrne and Paul Simon, began working with musicians from other countries. In 1990 the music magazine *Billboard* started a world music chart—a list of the top-selling world music albums. In 1991 the first Grammy awards for world music were given.

Did You Know?

Tiger Woods won six straight golf tournaments in 1999–2000. This was the second-longest winning streak in professional golf history.

Popular world music performers have included Cesaria Evora, from Cape Verde; Nusrat Fateh Ali Khan, from Pakistan; and Youssou N'Dour, from Senegal. The Gipsy Kings, from France, and the Buena Vista Social Club, from Cuba, were popular world music groups.

World War I

A poster encouraged British people to join the army during World War I. There was also a U.S. version, in which the man with the pointing finger was a character called Uncle Sam.

World War I lasted from 1914 to 1918. It was known at first as the Great War and the War to End All Wars. It was the largest war that the world had seen up to that time. Most of the battles took place in Europe and the Middle East. More than 8 million soldiers and sailors died, and more than 20 million were injured.

The war was so bad that many people thought no one would ever start another war. However, the results of World War I helped to cause World War II, which broke out in 1939.

War Breaks Out

A murder in the city of Sarajevo led to the war. Sarajevo was the capital of Bosnia, a region of the Austro-Hungarian Empire. On June 28, 1914, a Bosnian who was loyal to the country of Serbia shot and killed the Austro-Hungarian emperor's nephew, Archduke Francis Ferdinand. Austria-Hungary accused Serbian government workers of planning the crime.

On July 28 Austria-Hungary declared war on Serbia. Both countries asked for help from their friends. Austria-Hungary's friends were Germany and Italy. Their group was called the Triple Alliance. Serbia was a small country, but Russia protected it. Russia's friends were France and the United Kingdom (Great Britain). Their group was called the Triple Entente.

Within a few weeks most of the countries of Europe were at war. Both sides soon got new names. The Triple Alliance became the Central Powers, and the Triple Entente became the Allies. Italy did not go to war at first.

The Western Front

Battlefields west of Germany were called the Western Front. The Germans had hoped for an easy victory on the Western Front. But in September 1914 the

Gavrilo Princip was the name of the Bosnian who killed Archduke Francis Ferdinand.

Allies forced back the Germans at the battle of the Marne, a river in France.

The armies on the Western Front then began four years of trench warfare. Each side dug long trenches into the ground. The soldiers stayed in these trenches for protection. A “no-man’s land” covered with barbed wire lay between the trenches. Both sides used rapid-firing machine guns against anyone who tried to get across the no-man’s land.

Soldiers fought two of the war’s worst battles on the Western Front in 1916. The battle of the Somme took place

near the Somme River in France from July to November. More than 600,000 Allied soldiers were killed, wounded, captured, or missing. They gained only about 5 miles (8 kilometers) of ground. The French and the Germans fought another long battle near the French town of Verdun in 1916.

Both sides tried new ways to break through trench defenses. The Germans used a poison gas called chlorine against Allied troops in April 1915. Both sides then tried other chemical weapons. Soldiers got gas masks for protection against them. The British invented an

Almost all the battles of World War I were fought in Europe and the Middle East. The two sides fighting each other were known as the Allies and the Central Powers. Countries that did not side with either group were called neutral.

African American troops served in the trenches of the Western Front during the last years of World War I.

armored car called a tank. Tanks had crawler tracks to move them through trenches and barbed wire. The British first used tanks in 1916.

The Eastern Front and the Middle East

Battlefields east of Germany were called the Eastern Front. Armies moved faster on the Eastern Front. In 1914 Russian armies pushed west into Germany and Austria-Hungary. In 1915 the Germans drove them back. Bulgaria then joined the Central Powers. The troops of Germany, Austria, and Bulgaria took Serbia. An Allied force landed at Salonika (now Thessaloníki) in Greece to help the Serbians. However, the Allies made little progress until the end of the war.

At the end of 1914 the Ottoman Empire (centered in what is now Turkey) joined the Central Powers. The Ottomans attacked Russia. British, Australian, and New Zealand troops tried to

stop the Ottomans on Turkey's Gallipoli Peninsula, but they failed.

In 1915 Italy joined the Allies. The Italians lost many soldiers fighting the Austrians.

When the war began, the Ottoman Empire ruled Syria, Palestine, and Mesopotamia (now Iraq). In 1915 British-led troops tried and failed to take Baghdad (now the capital of Iraq). In March 1917 they finally succeeded. Later that year, the British took Palestine. In 1918 they took Syria as well.

The War at Sea

The British had more and better warships than the Germans. The British Navy was able to stop some ships from reaching German ports. Such an action is called a naval blockade.

However, the British were not able to stop German submarines. In 1915 the Germans announced that they would try to sink all enemy ships in British waters. On May 7, 1915, a German submarine sank the British passenger ship *Lusitania*. Nearly 1,200 people died, including many U.S. citizens.

The submarine attacks hurt the United Kingdom. By April 1917, one of every four supply ships that left the country never returned. By the end of that month, the country had only a six weeks' supply of grain left.

The Allies tried to defend their supply ships by putting guns on them. They also had them sail in convoys, or groups,

Did You Know?

German submarines were called U-boats. The term was short for "undersea boat" (*Unterseeboot* in German).

protected by warships. In all, German submarines caused the loss of about 6,000 Allied ships. The United Kingdom alone lost 13,000 lives in these attacks.

The War in the Air

The airplane had been invented only 11 years before the war began. At first Germany used floating aircraft called zeppelins, rather than airplanes, to bomb the United Kingdom. Then the British built anti-aircraft guns to shoot down the zeppelins.

During the war both sides built several kinds of warplanes. Fighter airplanes had machine guns to shoot at other airplanes. In 1917 the Germans started dropping bombs from airplanes. In the United Kingdom these bombings killed about 1,300 people and injured about 3,000.

Fighter pilots got into battles called dog-fights as they tried to shoot each other down.

Events of 1917

The Russian Revolution in 1917 changed the Eastern Front. A group called the Bolsheviks took over Russia in November. They made peace with the Central Powers almost immediately. The Germans were then able to move their troops elsewhere.

Meanwhile, the United States entered the war on the side of the Allies. President Woodrow Wilson at first did not want to go to war. He changed his mind because Germany kept attacking U.S. supply ships. The United States also found out that Germany had promised to give Texas, New Mexico, and Arizona to Mexico in return for Mexico's help in the war. The United States declared war on Germany on April 6, 1917.

The Tide Turns

During the winter of 1917–18, there were more German soldiers than Allied soldiers on the Western Front. In 1918 the situation changed, as nearly 10,000 U.S. troops landed each day in France. By November, the Allies had driven back the Germans to the battle lines of 1914.

The Central Powers started surrendering. The Bulgarians gave up on September 29, 1918. On October 30 the Austrians asked for a cease-fire (an end to fighting). The Ottomans gave up on the same day.

By this time, the German people were starving. The naval blockade was keeping food shipments from reaching the country. On November 11, 1918, Ger-

man government leaders signed an armistice—an agreement that ended the fighting.

The Peace

The Allies met in January 1919 and wrote a document called a peace treaty. The treaty allowed Germany to keep only a small army and navy. Germany was also forced to pay a large amount of money to the Allies. In addition, the treaty started the League of Nations, an organization that was supposed to prevent future wars.

German and Allied representatives signed the Treaty of Versailles on June 28, 1919. (Versailles is a town near Paris, France.) Separate treaties made peace with Austria, Bulgaria, and the Ottoman Empire. However, the U.S. Senate refused to ratify, or agree to, the Treaty of Versailles. Some senators were against the treaty because they did not like the League of Nations.

The Allies' dreams of peace did not last long. The German people did not like being punished. They brought Adolf Hitler to power in 1933. He built up the German military and started to conquer neighboring countries. The League of Nations could not stop him. His actions led to World War II.

World War II

World War II started in 1939. By the time it ended in 1945, the war involved nearly every part of the world. The two sides that fought the war were called the Axis powers and the Allies. Germany, Italy, and Japan were the major Axis powers. The major Allies were the United States, the Soviet Union, the United Kingdom (Great Britain), and France. China also aided the Allies.

More people died in World War II than in any other war. Experts guess that 40 to 50 million people lost their lives. Many were civilians (people not fighting the war). About 6 million were victims of the Holocaust—a German plan to kill people that they thought were inferior.

Events Leading to War

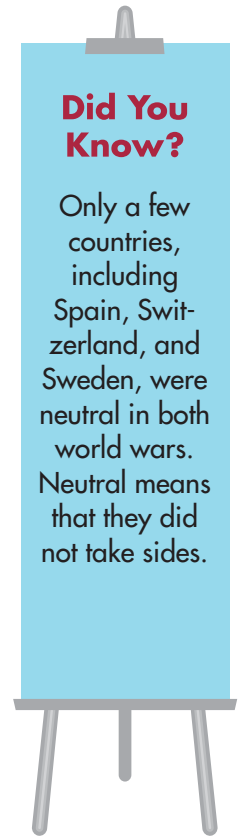

Japan, Italy, and Germany all committed warlike acts in the 1930s. In 1931 Japan began an invasion of China. Italy, led by Benito Mussolini's Fascist Party, conquered the East African country of Ethiopia in 1935.

Germany was the biggest threat to world peace. Adolf Hitler and his National Socialist, or Nazi, Party wanted Germans to rule over everyone else. In March 1938 German troops marched into Austria.

Hitler next wanted a part of Czechoslovakia where German-speaking people lived. Great Britain and France agreed to let him have it. They hoped to satisfy

Did You Know?

Only a few countries, including Spain, Switzerland, and Sweden, were neutral in both world wars. Neutral means that they did not take sides.

Hitler so that he would make no more demands. Their plan—called appeasement—was a failure. Within six months Germany took control of all of Czechoslovakia.

Hitler then planned to take over Poland. Britain and France promised to help Poland in case Germany attacked it. Germany prepared for war by making peace with the Soviet Union (which was not yet on the Allies' side) in August 1939. Germany did not want to fight Britain, France, and the Soviet Union all at the same time.

War with Germany Begins

Poland

On September 1, 1939, Germany invaded Poland. This began World War II. The Germans used a new kind of attack. They called it blitzkrieg, or “lightning war.” Blitzkrieg relied on fast-moving tanks and warplanes to shock the enemy into surrendering.

After this invasion, Britain and France declared war on Germany. Australia, New Zealand, Canada, India, and South Africa joined Britain on the side of the Allies. But no one could help when the Soviet Union attacked Poland on September 17. Germany and the Soviet Union divided Poland between them. The Soviet Union also invaded Latvia, Lithuania, Estonia, and Finland during 1939.

Scandinavia and the Low Countries

Between April and June 1940 the Germans took over Norway and Denmark.

In May they moved into the Low Countries—Belgium, The Netherlands, and Luxembourg.

France

In mid-May 1940 the first German troops crossed into France. By June 14 the Germans had entered Paris, the French capital.

On June 22 France agreed to let Germans rule most of their country. However, many French people continued to fight the Germans. They were called the Free French. They took orders from Charles de Gaulle. De Gaulle's headquarters were in Britain.

As France was falling to the Germans, Italy declared war against France and Britain. On June 10, 1940, Italy entered the war as an Axis power.

Great Britain

Hitler's next target was the island of Great Britain. Starting in June 1940,

Firefighters try to control the damage from a German bombing attack on London, England, in 1941, during World War II.

German warplanes began bombing Britain. However, the British had a new invention called radar. Radar warned the British when German aircraft were nearing. British fighter airplanes shot down many attackers. This battle, called the battle of Britain, was the world's first major battle fought in the air.

The Germans soon decided not to invade Britain. Instead, they dropped more bombs on London and other cities until May 1941.

The Atlantic Ocean

The British also fought the German navy in the Atlantic Ocean. Early in the

war, German submarines sank many of the supply ships that delivered food and weapons from North America. In 1943 the Allies began to use aircraft carriers to protect convoys, or groups, of supply ships. Using radar to spot enemy submarines also helped the Allies. The number of supply ships reaching Britain started to increase in mid-1943.

North Africa

In the autumn of 1940 the Italians invaded Egypt. They wanted to control the Suez Canal, which linked the Mediterranean Sea to the Red Sea and the Indian Ocean. However, the British drove the Italians back.

Then the German general Erwin Rommel led the Germans to victories in North Africa. In 1942 British forces finally stopped Rommel in two battles at El-Alamein, Egypt. By November 6 the British had driven the Germans from Egypt.

The Soviet Union

After conquering the countries on Germany's borders, Hitler invaded the Soviet Union. The attack began on June 22, 1941. The Soviet Union joined the Allies soon afterward. The Soviets stopped the Germans on the edges of Moscow (the Soviet capital) and Leningrad (now Saint Petersburg).

In 1942 Hitler decided to take the Soviet city of Stalingrad (now Volgograd). The fight at Stalingrad was the largest single battle in World War II.

About 1.9 million soldiers died on both sides. The Germans surrendered in January 1943. After Stalingrad, the Soviets gradually drove out the Germans.

War with Japan Begins

Great Britain, France, and The Netherlands ruled many islands in the Pacific Ocean. They ruled much of Southeast Asia as well. With these countries now at war, Japan saw an opportunity to take away their colonies. The Japanese began by taking French Indochina (now Laos, Cambodia, and Vietnam) in 1940 and 1941.

Pearl Harbor

On the morning of December 7, 1941, Japanese warplanes attacked U.S. warships at the Pearl Harbor naval base in Hawaii. They sank or crippled eight big battleships, destroyed more than 180

During World War II, many U.S. women worked in factories that made warplanes and other products. They took the places of men who were fighting the war.

aircraft, and killed more than 2,000 Americans.

The Pearl Harbor attack brought the United States into the war. Within a few days, the United States was at war with Germany and Italy as well.

The Philippines

Japan also bombed the Philippine Islands, which were a U.S. possession. U.S. and Philippine forces fought until the Japanese defeated them. The Philippines surrendered in May 1942. Japan also conquered Singapore, the Netherlands Indies (now Indonesia), and Burma (now Myanmar).

Coral Sea and Midway

The battles of the Coral Sea and Midway stopped the Japanese push. In the Coral Sea, near Australia, the Allies

stopped a Japanese attack on the island of New Guinea in May 1942. In June, near the tiny island of Midway in the North Pacific Ocean, U.S. airplanes destroyed many of Japan's ships. However, Japan still controlled a vast area.

End of the War with Germany

North Africa and Italy

In November 1942 Allied forces landed in Morocco and Algeria in North Africa. They defeated German and Italian forces in May 1943.

The Allies followed up their North African successes by invading Italy. Soon afterward, Italians overthrew Mussolini. Italy surrendered in September 1943. However, German troops still held most of the country. The Allies took Rome, the capital, on June 4, 1944.

D-Day and Battle of the Bulge

June 6, 1944, is called D-Day. On that day, 156,000 troops from the United

U.S. troops waded to shore on D-Day, June 6, 1944. Their goal was to drive the Germans out of France.

States, Britain, and Canada attacked the beaches of Normandy in northern France. After fierce fighting, the Allied armies moved inland. They freed Paris on August 25.

The Allies then moved toward Germany. The Germans made one last attack on the Allies in December 1944. The Germans lost this fight, called the battle of the Bulge, by January. In March 1945 the Allies drove into western Germany.

Germany Surrenders

By February 1945 it was clear that Germany would lose the war. The Allied leaders—U.S. president Franklin D. Roosevelt, British prime minister Winston Churchill, and Soviet premier Joseph Stalin—met in Yalta (now in Ukraine). There they made plans for Europe after the war.

Meanwhile, Soviet troops pushed through Germany from the east. By

Winston Churchill (left) of the United Kingdom, Franklin D. Roosevelt (center) of the United States, and Joseph Stalin (right) of the Soviet Union met in Yalta (now in Ukraine) in February 1945 to make plans for postwar Europe.

April 25 the Soviets had surrounded Berlin, the German capital. Hitler killed himself on April 30. Germany surrendered at midnight on May 8, 1945.

End of the War with Japan

Island Warfare

In the Pacific Ocean, U.S. troops captured island after island from the Japanese. In February 1943, after six months of jungle warfare, U.S. forces drove the Japanese from Guadalcanal, one of the Solomon Islands. The United States captured Saipan in the Mariana Islands in July 1944. From Saipan, U.S. airplanes began bombing Japan.

In October 1944 soldiers led by U.S. general Douglas MacArthur landed in the Philippines. The United States captured the Philippine capital of Manila in March 1945.

U.S. forces landed on Iwo Jima in February 1945 and on Okinawa in April 1945. Both these islands belonged to Japan. During the fight for Okinawa, Japanese pilots made kamikaze attacks—they crashed their airplanes into U.S. ships on purpose. Eventually, though, U.S. forces captured both islands.

Hiroshima and Nagasaki

By 1945 scientists in the United States had invented the atomic bomb, a new weapon of immense power. On August 6, 1945, a U.S. airplane dropped an atomic bomb on Hiroshima, Japan. More than 70,000 people died from the explosion and fires. On August 9

another U.S. plane dropped an atomic bomb on the city of Nagasaki. Japan surrendered on September 2, 1945. This ended the war.

Results of the War

After the war's end, the Allies divided Germany among themselves. The Allies also punished Nazi leaders after putting them on trial in Nuremberg, Germany. They punished Japan's wartime prime minister, Tojo Hideki, as well.

After the war the United States and the Soviet Union were the most powerful countries in the world. Despite having been Allies, the two countries soon began a long struggle called the Cold War.

Worm

Worms are soft, long-bodied invertebrates, or animals without a backbone. There are at least 20,000 species, or kinds, of worm. They are not all related. In fact, they belong to several different animal groups. Some well-known groups of worms are flatworms, roundworms, and segmented worms.

Worms are found almost all over the world. Some worms live in water. Other

worms live in the ground and help to improve the soil. Many worms, including some roundworms, are parasites. Parasites live inside other plants and animals and can cause harm.

Worms vary in size. Some are so small that they are invisible to the naked eye. Others are more than 100 feet (30 meters) long.

Worms usually have a tubelike, flattened, or leaflike body shape. Earthworms and other segmented worms have a body divided into segments, or rings. Worms usually lack legs or other limbs. Some types have bristles that help them to move.

Many worms have sense organs that can detect changes in their environment. A few have light-sensing organs.

Different worms reproduce in different ways. In some types of worm, males and females mate. Other worms can reproduce on their own because they have

The soft body of an earthworm is divided into segments, or rings.

both male and female reproductive parts. Some worms can develop new bodies from parts of their own body.

Wounded Knee

Wounded Knee is a small town that is important in Native American history. Two conflicts between Native Americans and U.S. officials took place there, one in 1890 and the other in 1973. Wounded Knee is located on the Pine Ridge Indian Reservation in South Dakota. An Indian reservation is a piece of land that the U.S. government has set aside for Native Americans. The Pine Ridge Reservation is home to the Lakota Sioux people.

American Indian Movement members meet with a U.S. Department of Justice worker (right) during the Wounded Knee protest of 1973.

1890

During the 1800s white settlers and gold miners took away much Sioux land. They also killed many bison (buffalo), which the Sioux depended on for food. But a religious leader named Wovoka gave the Sioux new hope. He told them that a ceremony called the Ghost Dance would drive away the whites and bring back the bison. The U.S. government sent troops to stop the Ghost Dance. Government police killed Sitting Bull, a Sioux chief, while trying to arrest him.

A few hundred Sioux then left their homes. U.S. troops followed them. The Sioux surrendered and camped near Wounded Knee Creek. On December 29, 1890, while the soldiers were taking away the weapons of the Native Americans, a shot went off. Then the soldiers fired their machine guns at the Sioux. More than 200 Sioux were killed, including many women and children.

1973

More than 80 years later, on February 27, 1973, Wounded Knee was the site of another dispute. About 200 members of a group called the American Indian Movement took control of Wounded Knee by force. They felt that Native Americans were not being treated well, and they wanted the government to help. They refused to leave.

The protest lasted 70 days. Government workers shot and killed two Native Americans during that time. The Native Americans left Wounded Knee only after

the government agreed to hear their complaints.

Wrestling

In the sport of wrestling, two opponents try to throw each other to the ground. Wrestlers need skill, physical strength and quickness, and good conditioning. Wrestling is one of the world's oldest sports. The ancient Egyptians wrestled. In ancient Greece wrestling was an important part of the Olympic Games. Wrestling probably developed into a sport from hand-to-hand combat in wartime.

Wrestling Styles

Professional wrestling in the United States is a mixture of sport and entertainment. Professional wrestlers use spectacular and dangerous moves that they must practice together in order to avoid injury.

Other countries have their own styles of wrestling. In Japan, for example, sumo wrestling is very popular. Sumo wrestlers wear loincloths and grip each other by the belt. Sambo is a wrestling style that started in the Soviet Union in the 1930s. It includes moves from the Japanese martial art called judo.

Two styles of wrestling are included in the modern Olympic Games: Greco-Roman and freestyle. A version of freestyle wrestling is a sport at high schools and colleges in the United States. Greco-

Sumo is a wrestling style that is popular in Japan. A sumo wrestler tries to push his opponent out of the ring or to force him to the floor.

Roman wrestling is more popular in Europe. The rest of this article has to do with Greco-Roman and freestyle wrestling.

Wrestling Mats and Equipment

Wrestling matches take place on padded mats. The mats vary in size and layout depending on the level of the competition. For example, an Olympic wrestling mat is similar but not quite the same as a mat used at a high school.

Wrestlers wear tights that cover the thighs, waist, and midsection. Special shoes help wrestlers to grip the mat. Wrestlers sometimes wear kneepads and headgear to protect the ears.

A Wrestling Match

Contests of freestyle and Greco-Roman wrestling are similar. Wrestlers in each style try to throw or press the opponent onto his back. The goal is to have both of the opponent's shoulder blades touch

the mat at the same time. This is called a fall, or a pin.

A match starts when two wrestlers meet at the center of the mat. Both wrestlers are standing as the match begins. They then try to grab and control the opponent by using various moves, which are called holds. In the Greco-Roman style, wrestlers can use holds only above the waist. They cannot trip or wrap the legs around an opponent. Freestyle wrestling allows almost all types of leg and arm holds. Freestyle wrestlers use their legs to trip, wrap, or hold the opponent. The rules usually forbid only actions that may injure an opponent, such as strangling, kicking, and punching.

A referee stands on the mat with the wrestlers. The referee awards points for successful moves. The referee also declares when a fall takes place. In international freestyle and Greco-Roman wrestling, a fall occurs when one wrestler forces the other's shoulder blades to the mat for just an instant. In

Wrestlers from different regions of China compete in a national tournament. Wrestling is popular all over the world.

school wrestling programs in the United States, the opponent's shoulder blades must stay pinned to the mat for at least a second.

A fall results in an immediate victory. Sometimes a fall does not happen before the match ends. Then the wrestler with more points wins.

History

Wrestling existed in Babylonia and Egypt as early as 3000 BC. The people of ancient India and China also wrestled. Wrestling was a major sport in ancient Greece. Milon of Croton was a famous Greek wrestler who lived in the 500s BC. He won the wrestling championship of the Olympic Games six times.

Starting in the 1700s wrestling matches took place at fairs and circuses. Outstanding wrestlers competed against anyone who wanted to challenge them. Wrestling was popular in the United States during the frontier period. Frontier wrestling was a rough sport. Any hold except strangling was allowed. A match lasted until someone gave up.

Greco-Roman and freestyle wrestling developed in the second half of the 1800s. In 1896 Greco-Roman wrestling was a part of the first modern Olympic Games. Freestyle wrestling was introduced at the 1904 Olympic Games. Women's freestyle wrestling became an Olympic event in 2004.

Martial Art • Olympic Games

Wright, Frank Lloyd

Frank Lloyd Wright designed a house called Fallingwater to blend into the hillside around it. He even left room for a stream to run under the house.

Frank Lloyd Wright was a U.S. architect who designed many houses and public buildings. Wright had a great influence on the architecture of the 1900s.

Wright was born on June 8, 1867, in Richland Center, Wisconsin. He studied engineering at the University of Wisconsin. In 1887 Wright moved to Chicago, Illinois. In 1893 he opened his own architectural office.

Wright became the leader of a type of architecture called the Prairie style. A house in this style is low-lying and blends into its surroundings. Wright also designed public buildings. One of his most famous buildings is the Guggenheim Museum in New York City. This building has a long spiral ramp instead of separate floors.

Wright died on April 9, 1959, in Phoenix, Arizona. Many of his buildings are open to the public.

Architecture

Wright, Wilbur and Orville

Two U.S. inventors named Wilbur and Orville Wright designed, built, and flew the first airplane, in 1903. Some features of their design are still used in airplanes today.

Wilbur Wright was born on April 16, 1867, near Millville, Indiana. Orville Wright was born on August 19, 1871, in Dayton, Ohio. Their father was a Christian minister.

Early Experiments with Flight

As young men the Wrights made and repaired bicycles. In 1896 they became interested in gliders. A glider is an aircraft with fixed wings (wings that do not flap)

Orville and Wilbur Wright

Did You Know?

The Wright brothers' first airplane, the flyer, had wings that were made of wood and muslin cloth.

and no power supply. The flow of wind past the wings keeps a glider in the air.

In 1900 the Wrights started testing gliders near the town of Kitty Hawk, North Carolina. The sand dunes there were useful for their flight experiments. The windy hills made it easier to take off. The sand made it safer to land. There the Wrights tried different kinds of wings and control systems.

Building an Airplane

After studying gliders, the Wrights decided to design and build an airplane. An airplane is like a glider but has its own power supply. In 1903 the Wrights built an airplane with a gasoline engine. The engine powered two propellers.

The Wrights tested their plane in Kill Devil Hills, near Kitty Hawk. On December 17, 1903, Orville made the first flight in the airplane. He flew 120 feet (37 meters) in 12 seconds. Later that day Wilbur flew 852 feet (260 meters) in 59 seconds.

Orville Wright makes the first successful controlled airplane flight in history, on December 17, 1903. The flight took place in Kill Devil Hills, North Carolina.

The Wrights continued to make improvements. By 1905 they could stay in the air for about 40 minutes.

In Business

In 1908 the Wrights sold an airplane to the U.S. Army. Then they began demonstrating airplanes in the United States and Europe. They soon became famous.

In 1909 the Wrights formed the Wright Company. The company built airplanes in Dayton. It had its own flying field and flight school. In 1910 the brothers also started the Wright Exhibition Company. This company hired airplane pilots to perform stunts in front of audiences. They closed the company in 1911, after several employees had died in crashes.

Later Years

Wilbur died of a disease on May 30, 1912, in Dayton. After Wilbur's death, Orville ran the Wright Company until he sold it in 1915. He continued to work as an inventor. On January 30, 1948, Orville died of a heart attack in Dayton.

Writing

Writing is a way of showing speech, or spoken language, with marks. People can make these marks on stone, paper, or a computer screen. People use writing to communicate with others.

Reading is the process of looking at and understanding writing. When people know how to read and write, they are called literate.

Types of Writing

The simplest type of writing uses pictures to stand for words or ideas. Many Native American groups used this type of writing. In other types of writing, marks of various designs can stand for whole words or parts of words. Chinese and Japanese characters are examples of this kind of writing. In alphabetic writing, marks called letters each stand for a different sound. The alphabet used for English is an example of this type of writing.

History

In prehistoric times people scratched marks on stones or wood. Some made cave paintings that showed people and animals. But these marks and drawings were not true writing systems.

As people began to trade, they developed systems for keeping records of their business. They created counting tokens to show how many animals or crops they had traded. Eventually different marks came to stand for the different goods. For example, a mark representing a cow looked much like a cow.

An important advance in writing took place when people began using marks to stand for more than just objects. Certain marks could then represent ideas, such as love or morning. At some point people started using marks to stand for the sounds of speech.

A clay tablet has a record of the sheep and goats that someone owned in ancient Mesopotamia (in modern Iraq). The writing system used on the tablet is called cuneiform.

The Sumerians of Mesopotamia (in modern Iraq) invented the first real writing system about 5,000 years ago. This writing, called cuneiform, was a system of wedge-shaped dents pressed into slabs of mud or clay. Not much later the Egyptians invented their own writing system, called hieroglyphics. About 3,000 years ago Semitic peoples in the Middle East created the first alphabets.

Most of the people who lived in early civilizations did not know how to read or write. In many places people called scribes wrote things down for others. By the AD 1400s, however, more people were becoming educated. The invention of the printing press in the middle of the 1400s helped make books and other writings widely available. By the 1900s many countries were requiring their

A girl practices writing letters on a blackboard.

children to go to school to learn how to read and write. Today most people in the world have these skills.

Wyandot

The Wyandot are Native Americans of the central United States and southern Canada. They call themselves the Wen-

A museum in Ontario, Canada, shows what a Wyandot village may have looked like. In one building dried tobacco hangs from the ceiling.

dat. When French explorers met them in the early 1600s, they lived in what is now southern Ontario. The French called them the Huron. The Wyandot are still sometimes known by that name.

The Wyandot traditionally lived in longhouses, which were large enough to house several families. They built their longhouses using wood and bark. They grew corn, beans, squash, and sunflowers. They also fished and hunted deer. After the French arrived, the Wyandot traded furs to them for goods such as metal tools, cloth, and guns.

In the middle of the 1600s the Wyandot were attacked by their enemies, the Iroquois. The Iroquois destroyed Wyandot villages and took some Wyandot as captives. Other Wyandot escaped to the west. Still others went to live with the French in Quebec.

During the 1600s and 1700s the Wyandot who had moved west moved again. For a time they lived in what are now Michigan, Wisconsin, Illinois, and Ohio. In the middle of the 1800s the U.S. government forced these Wyandot to move to Indian Territory (now Oklahoma).

At the end of the 20th century about 2,000 Wyandot lived in the United States, mostly in Oklahoma or Kansas. Other Wyandot lived in Canada, in Ontario and Quebec. There they are known as the Huron-Wendat.

Wyoming

The Snake River and the Teton Range are attractions of Wyoming's Grand Teton National Park.

The state of Wyoming lies in the western United States. An explorer once described Wyoming as a land where “nature had collected all of her beauties together in one chosen place.” Wyoming's natural beauty is preserved in several national parks and monuments. One of them, Yellowstone National Park, became the world's first national park in 1872.

Wyoming's nickname is the Equality State. In 1869 Wyoming allowed women to vote and to hold public office. This was the first time in U.S. history that women had been given these rights. Wyoming also elected the country's first female governor, Nellie Tayloe Ross, in 1924. The state capital is Cheyenne.

Geography

Wyoming borders Montana on the north and northwest. To the west is

Idaho. Utah lies to the southwest, and Colorado lies to the south. Wyoming's eastern neighbors are Nebraska and South Dakota.

Wyoming is a state of high mountains and vast plains. The Rocky Mountains cover the western two thirds of the state. The Rockies are made up of several ranges separated by wide valleys and basins. The flat grasslands of the Great Plains cover eastern Wyoming. The climate is dry, with cold winters and warm summers.

People

Wyoming has the smallest population of all the 50 states. Non-Hispanic whites make up almost 90 percent of the population. About 6 percent of the people are Hispanic. Native Americans make up more than 2 percent of the population.

Wyoming's African American and Asian populations are very small.

Economy

Mining is Wyoming's most important industry. The state produces a lot of coal, natural gas, and oil. Other mining products include the clay called bentonite and the mineral trona, which is used to make soap and glass.

Almost all the agricultural land in Wyoming is used for ranching. Cattle and sheep are the most valuable livestock. The main crops include wheat, oats, barley, hay, corn, sugar beets, beans, and potatoes.

Tourism is also important to Wyoming's economy. Millions of people visit the state each year to enjoy its national parks, including Yellowstone and Grand Teton National Park. Popular tourist activities include camping, fishing, hunting, and hiking, as well as skiing and other winter sports. Wyoming's cowboy culture is another tourist attraction. The world's largest rodeo is held each summer in Cheyenne during a festival called Frontier Days.

History

The Shoshone, the Arapaho, and other tribes lived in the Wyoming area when white explorers arrived in the 1700s. The United States bought most of the region from France in the Louisiana Purchase of 1803. In about 1807 John Colter, a member of the Lewis and Clark Expedition, explored the Yellowstone Park area. Fort William (later called Fort Laramie) was built in the

southeast in 1834. It was the first lasting settlement in what is now Wyoming.

The cross-country railroad reached Cheyenne in 1867. The railroad encouraged settlers to come to Wyoming. A year later the U.S. Congress created the Wyoming Territory. White settlement was limited to southern Wyoming until 1876, when the local Native Americans were defeated. Wyoming became a state in 1890.

Ranching developed into Wyoming's main industry in the late 1800s. For a while the availability of vast ranches and farmland drew people to Wyoming. During the 1900s mining replaced ranching as the most important part of the economy. In the 1980s the oil industry suffered, and many people lost their jobs. Wyoming's population fell as people left the state to look for work. But between 1990 and 2000 the state's population again began to grow.

Two cowboys appear in a rodeo in Cody, Wyoming.

X-rays are powerful waves of energy that can travel through substances that light cannot.
(See X-rays.)

X-rays

X-rays are powerful waves of energy. Like light, X-rays are a form of radiation. They are very useful because they can go through substances that light cannot. X-rays can show images, or pictures, of the inside of an object, such as a suitcase or the human body.

How X-rays Work

An X-ray machine makes X-rays and directs them toward an object. The X-rays pass through some parts of the object but are blocked by other parts. For example, X-rays directed at a body pass through the skin and soft tissues, such as muscle. But hard body parts, such as bones, block the X-rays. Special film behind the body captures the image made by the X-rays. When the film is developed, the hard parts appear white on the film. The soft parts appear black.

Medical Uses

X-rays are an important tool in medicine and dentistry. Doctors use X-rays to

In a "positive" X-ray image the black and white areas are reversed, so bones look dark.

Security workers at airports use X-ray machines to check for dangerous items in passengers' bags.

find diseases such as cancer and to study broken bones. Dentists use them to spot cavities in teeth.

X-rays can damage or destroy the body's cells. To protect the patient, the parts of the body that are outside the area being examined are shielded from the X-rays. But the damaging effects of X-rays can be useful, too. Doctors sometimes use X-rays to kill cancerous growths.

Other Uses

X-rays also have many uses outside of medicine. Scientists use X-rays to study the structure of many things, both living and nonliving. Special X-ray telescopes pick up X-rays given off by objects in outer space, such as distant stars. Manufacturers use X-rays to find hidden flaws in products. At airports, security equipment uses X-rays to look for hidden weapons in the baggage of travelers.

Yak

The yak is a large, shaggy ox with humped shoulders. It lives on high land, mostly in the part of China called Tibet. For centuries the people of Tibet have tamed yaks to use as work animals and as a source of food. The yak is related to cattle, buffalo, and bison. Its scientific name is *Bos grunniens*.

The yak lives in cold places with few plants. Sometimes it has to roam a long way to find enough grass to eat. Its long hair helps it stay warm. The yak also needs a lot of water. In winter it often eats snow.

Some yaks live in the wild, but they are very rare. Wild yaks have blackish brown hair and large horns. Wild males may weigh up to 2,200 pounds (1,000 kilograms). Females are smaller. Wild yaks live in herds made up of females and young animals. Adult males live alone or in smaller groups.

Domestic, or tamed, yaks are much smaller than wild yaks. They can be red, brown, black, or black and white. They

A boy in Nepal leads a domesticated, or tamed, yak.

have smaller horns than wild yaks. Some domestic yaks have no horns.

People use domestic yaks for carrying and pulling heavy loads. Yaks are also kept for their meat and milk. The hair is used to make rope and cloth. The skin is used for caps, coats, and blankets.

Yakama

The Yakama are Native Americans of the U.S. state of Washington. They have a large reservation on the land where they have lived for thousands of years. The nearby city of Yakima was named after the tribe. The tribe's name is sometimes spelled Yakima.

The Yakama moved with the seasons. In winter they lived in homes called lodges. They built their lodges by covering a wooden frame with mats woven from leaves. In spring the Yakama camped in places where they could gather wild plants to eat. In summer they moved to the Columbia River area to fish for salmon. In autumn they hunted and gathered berries in the Cascade Mountains. In the early 1700s the Yakama got horses from other tribes. On horseback they traveled east onto the Great Plains to hunt bison (buffalo).

In 1805 the U.S. explorers Meriwether Lewis and William Clark passed through Yakama lands. Fur traders and Christian missionaries came next. The U.S. government wanted to open the tribe's

land to white settlers. From 1855 to 1858 the Yakama fought a war against U.S. troops. The Yakama lost and were forced to move to a reservation. At the end of the 20th century there were more than 8,000 Yakama living in the United States.

Yamoussoukro

Population
(2003 estimate)
185,600

Yamoussoukro is the capital of Côte d'Ivoire, a country in western Africa. It

became the official capital in the late 20th century. However, many government offices remained in Abidjan, the country's first capital and largest city.

One of the world's largest Christian churches is in Yamoussoukro. It is a type of Roman Catholic church called a basilica. It can hold 18,000 people.

Until the 1960s Yamoussoukro was a small village. In 1960 Côte d'Ivoire became an independent country with Abidjan as its capital. However, Yamoussoukro was the hometown of the country's first president, Félix Houphouët-Boigny. He spent large amounts of his family's money to make Yamoussoukro more modern. The city grew and became more important. In 1983 it became the official capital of Côte d'Ivoire.

Yangon

Population
(2005 estimate)
4,107,000

Yangon is the largest city and main port of Myanmar, a country in Southeast Asia. The city lies on the Yangon River. It is Myanmar's center of industry. Yangon was the country's capital until 2006.

The most famous site in Yangon is a group of ancient Buddhist temple buildings called the Shwedagon Pagoda. The city began as a settlement around this Buddhist site. The king of Myanmar developed the city as a port in the 1750s. After that Yangon grew.

The Sule Pagoda is one of the important Buddhist temple buildings in Yangon, Myanmar. Modern buildings surround the pagoda.

Great Britain captured Yangon in 1852. The British called the city Rangoon and the country Burma. In the 1880s the British took control of all of Burma. They made Rangoon the capital.

In 1948 Burma became an independent country. Rangoon remained its capital. In 1989 the country's government requested that people call the city Yangon and the country Myanmar. In 2006 the government moved the capital north to Naypyidaw, a site near the town of Pyinmana.

Yangtze River

The Yangtze is the longest river in China and in all of Asia. It is also the third longest river in the world, after the Nile (in Africa) and the Amazon (in South America). It is 3,915 miles (6,300 kilometers) long.

The Yangtze, which is also called the Chang Jiang, begins in the mountains of Tibet, a region of western China. It runs through mountains for most of its length. Near the end of its course it flows through wide, low plains. More than 700 streams and rivers flow into the Yangtze. The most important of these are the Yalong, Min, Jialing, Han, and Wu rivers. The Yangtze empties into the East China Sea near Shanghai in east-central China.

People have lived in the area around the Yangtze River for thousands of years.

Many people live on the plains of the lower Yangtze, where the soil is rich and good for farming. Nearly half of China's crops are grown in this area. They include rice, cotton, wheat, barley, corn, beans, and hemp. Many other people make a living by fishing in the Yangtze. Carp, bream, Chinese perch, lamprey, flatfish, and sturgeon are among the catch.

The Yangtze has been an important traffic route since the 1200s. The river connects inland and coastal ports with major cities, including Nanjing, Wuhan, and Chongqing. China's Grand Canal joins the Yangtze to other river routes.

Dams on the Yangtze help to control flooding. They also produce electric power. In addition, they allow large ships to travel farther inland on the river.

In 1994 workers began building the huge Three Gorges Dam across the Yangtze. People in hundreds of towns in the river valley left their homes to make way for the project. Workers finished the main part of the construction in 2006.

Yaqui

The Yaqui are a group of Native Americans who originally lived in northwestern Mexico. Today the tribe is still centered there, in the state of Sonora. Many Yaqui also live in the United States, in the state of Arizona.

The Yaqui traditionally built dome-shaped, wooden homes. They covered their homes with mats made of plant material. They grew corn, beans, and squash. They also hunted, fished, and gathered wild plants.

Spanish explorers arrived in Yaqui territory in 1533. Over the next several hundred years the Yaqui fought the Spanish, and later the Mexicans, for control of their land. In the 1880s the Mexican government took over the tribe's territory. The government sent thousands of Yaqui to southern Mexico, far from their homeland. Some Yaqui escaped and returned home. Others fled Mexico for the United States. They made new settlements in what is now southern Arizona.

In the 1930s the Mexican government returned much of the Yaqui's original territory to the tribe. Many Yaqui then moved back to Sonora. At the end of the 20th century there were more than 25,000 Yaqui in Mexico. Another 15,000 Yaqui lived in the United States. The tribe has a reservation near Tucson,

Yeltsin, Boris

Boris Yeltsin led Russia through its last days as a part of the Union of Soviet Socialist Republics, or Soviet Union. From 1991 through 1999 Yeltsin served as president of the independent country of Russia.

Boris Nikolayevich Yeltsin was born in Sverdlovsk (now Yekaterinburg), Russia, on February 1, 1931. He became an engineer as a young man.

In the 1960s Yeltsin joined the Communist Party—the political group that controlled the Soviet Union. In 1976 the party put him in charge of the Sverdlovsk region.

In 1985 Mikhail Gorbachev became the leader of the Soviet Union. Gorbachev made Yeltsin the leader of Moscow, the capital city. Yeltsin lost this job in 1987 because he pushed too hard for change.

In 1989 other Russians who wanted change elected Yeltsin to a seat in a new Soviet legislature. In 1990 he was elected president of the Russian republic. At the time, Russia was one of the 15 republics that made up the Soviet Union. Soon after that, Yeltsin left the Communist Party.

Boris Yeltsin led Russia during its last year as a part of the Soviet Union.

In August 1991 Yeltsin helped to stop a group of Communists from taking power away from Gorbachev. By this time, however, many of the Soviet republics wanted complete independence. In December 1991 Gorbachev resigned and the Soviet Union ceased to exist. The republics each became independent countries.

Yeltsin remained president of Russia. He tried to introduce changes in the economy, but some members of the legislature disagreed with him. Yeltsin won reelection in 1996. But by 1999 he had angered many legislators. They tried to remove him from office but did not succeed. Yeltsin retired on December 31, 1999. He died on April 23, 2007, in Moscow.

Yemen

Yemen is a country in the Middle East. From 1962 to 1990 Yemen was divided into two separate countries: North Yemen and South Yemen. Yemen's capital is Sanaa.

Geography

Yemen is on the southern tip of the Arabian Peninsula, a triangle of land in southwestern Asia. Yemen shares borders with Saudi Arabia and Oman. The Red Sea lies to the west, and the Gulf of Aden is to the south. The Gulf of Aden links the Red Sea with the Arabian Sea. The Arabian Sea lies to the southeast of Yemen. Several nearby islands belong to Yemen.

A narrow, sandy plain runs along Yemen's coasts. Mountains and other highlands rise in central Yemen. North of the highlands is a large, sandy desert. The desert and the coasts are hot and

A wall surrounds the oldest part of Sanaa, Yemen. The Liberty Gate is the most famous of the wall's many gates.

dry. The highlands have cooler temperatures and enough rainfall for farming.

Plants and Animals

Eucalyptus, sycamore, and fig trees grow in the highlands. Thorny shrubs grow in the dry areas. Date palm trees grow near the coasts.

Yemen's wildlife includes baboons, hyenas, foxes, and rabbits. Hawks, vultures, ravens, and other birds also live in the country.

People

Most of the people in Yemen are Arabs. Small groups of Somalis, other Africans, and South Asians also live in Yemen. Most people speak the Arabic language. Some people, especially in the cities, speak English as well. Nearly all the

people follow the religion of Islam. However, there are small groups of Hindus, Christians, and Jews.

The largest city is the capital, Sanaa. Sanaa is known for its ancient architecture, markets, and mosques (Muslim houses of worship). The country's second-largest city is Aden, the former capital of South Yemen. Aden has long been an important seaport. Although these cities are large, most Yemenis live in villages and small towns. A small part of the population is nomadic. This means that they travel from place to place.

Economy

Yemen's economy depends on the production of petroleum (oil). However, Yemen does not have as much oil as other countries in the Middle East. Yemen also produces metal products, cloth, and cement.

About half of Yemen's workers are farmers or herders. The main food crops are sorghum, tomatoes, potatoes, grapes, oranges, and wheat. Other crops include coffee and *qat*. Many Yemenis chew the leaves of the *qat* plant. Herders raise sheep, goats, and cattle. Fishing is another source of food.

History

In ancient times wealthy kingdoms ruled what is now Yemen. The kingdoms grew rich from trading frankincense and myrrh, which came from trees grown in the region. Many ancient peoples used frankincense and myrrh to make perfumes and medicines.

In the 600s the people of Yemen accepted Islam. Muslim leaders called imams then ruled Yemen. In the 1500s the Ottoman Empire took control of parts of Yemen. The Yemenis drove out the Ottoman Turks in the 1600s. The Turks returned in the mid-1800s and took over northern Yemen. Meanwhile the British began taking control of southern Yemen.

Two Yemens

The Ottoman Empire collapsed in 1918. Imams then ruled northern Yemen until 1962, when the last imam lost power. Northern Yemen became a new country called the Yemen Arab Republic, or North Yemen.

In 1967 the British left southern Yemen, and a socialist group took control of the area. (In socialism the government controls all businesses and property.) Another socialist government that took power in 1969 renamed the country the People's Democratic Republic of Yemen, or South Yemen.

Unification

In 1990 the two Yemens joined together as the Republic of Yemen. In 1994 southern rebels began a civil war against the government. Less than two months later the government defeated the rebels. In 2000 Yemen signed an agreement with Saudi Arabia concerning their common border, which had long been disputed.

Yew

Yews are evergreen trees and bushes that grow in the northern half of the world. There are several species, or types, of yew. They include the English yew and the western yew.

Some yew trees may reach 80 feet (25 meters) or more in height. Yews have many branches with narrow, sharply pointed leaves. The leaves are dark green above and lighter underneath. Each yew seed is surrounded by a red cup that looks like an open berry. Yew leaves and seeds are very poisonous. People and animals can get sick or die after eating them.

Yews grow very slowly but live very long. Some yews are thought to be more than 1,200 years old. Yews usually are not bothered by insects.

People trim some kinds of yew to use in landscaping. Yews are also important

Yoga

Yoga is a system of training for the body and the mind. The word yoga means “union” in the ancient Sanskrit language of India. People who follow the religion of Hinduism practice yoga to feel united with a higher power. They seek this union through posture (body position), breathing, and meditation (mental exercises). The most popular form of yoga is called hatha yoga.

Today many people who do not follow Hinduism practice yoga for exercise and

relaxation. The movements and positions used in yoga are gentler than many forms of exercise. As a result, people of many different ages and fitness levels can take part.

The practice of yoga involves learning a variety of postures. These body positions are known as asanas. One well-known asana is called the lotus position. In the lotus position, a person sits with his or her legs crossed. The legs are crossed tightly so that the foot of each leg can rest on the opposite thigh. Another common asana is the downward-facing dog. In this position, the hands and feet are flat on the floor, and the hips are raised toward the ceiling. People skilled at yoga can hold asanas for a long time.

Yoga also features different breathing exercises. Deep breathing helps to deliver oxygen to the blood. It also helps people to relax. While a person focuses on breathing, the mind becomes clearer.

Yom Kippur

A man blows a traditional trumpet called a shofar on the Jewish holiday of Yom Kippur.

Yom Kippur is the holiest day in Judaism. It is a day marked by prayer and fasting. Yom Kippur is observed on the 10th day of the Jewish calendar month Tishri. The holiday usually occurs in September or October.

In English, Yom Kippur is known as the Day of Atonement. The holiday's purpose is to purify the individual and community. On Yom Kippur Jews are forgiven for their sins against God. They also ask for forgiveness from people they have wronged. No work can be performed on this day. The day is generally spent in the synagogue, the Jewish house of worship.

Jews believe that on the 10th of Tishri, Moses came down from Mount Sinai with the second set of tablets of the Ten

Commandments. This event happened 40 days after the Israelites (the Jewish people) committed the sin of worshipping a golden calf instead of praying to God. Moses told the Israelites that they were forgiven. Since this time, the day was observed as Yom Kippur.

Yugoslavia

Yugoslavia was a country that existed in southeastern Europe from 1929 to 2003. It was created when several former kingdoms and territories joined together. They became the six republics, or states, of the country of Yugoslavia. Each republic had its own mixture of ethnic groups and religions. Tensions sometimes flared up between the different groups.

In the late 20th and early 21st centuries the republics broke apart to become independent countries. These countries are Bosnia and Herzegovina, Croatia, Kosovo, Macedonia, Montenegro, Serbia, and Slovenia.

Geography and People

Yugoslavia lay along the Adriatic Sea on the Balkan Peninsula of Europe. It shared borders with Italy, Austria, Hungary, Romania, Bulgaria, Greece, and Albania. Its capital was Belgrade, which is now the capital of Serbia.

Most of Yugoslavia's people were Slavs who spoke Slavic languages. The Slavs included several different ethnic groups. They were the Serbs, Montenegrins, Croats, Slovenes, Macedonians, and Bosnian Muslims (now called Bosniacs). These groups were related, but each group had its own separate history. Different groups also followed different religions. Many peoples who were not Slavs—including Albanians, Hungarians, and Turks—lived in Yugoslavia, too.

Did You Know?

The name Yugoslavia means "land of the South Slavs."

History

By the late 1800s the Ottoman Empire and Austria-Hungary ruled much of the Balkan region. Those two empires were defeated in World War I (1914–18). After the war several Balkan lands formed a new country. It was called the Kingdom of Serbs, Croats, and Slovenes. The kingdom changed its name to Yugoslavia in 1929.

Germany, Italy, and their allies invaded Yugoslavia in 1941, during World War II. A few years later, Josip Broz Tito led troops that freed Yugoslavia from the invaders. Tito became the country's leader. He set up a Communist government in Yugoslavia.

The country also gained a new form. It became a federation, or collection of six equal republics. Two sections of Serbia that wanted to be separate were also given some power. This angered the leaders of Serbia. But Tito was a strong leader. He helped hold the many different ethnic groups in all of the republics together in one unified country.

After Tito died in 1980 the country went through major changes. The new leaders were not able to hold the country together. Many neighboring Communist countries began to get rid of Communism during this period. Some of the Yugoslav republics wanted to do the same. They held elections and eventually declared themselves independent.

Serbia fought to keep the republics part of Yugoslavia. A bloody civil war raged until 1995.

After the war, Serbia and Montenegro were the only republics that remained part of Yugoslavia. In 2003 they formed a different country, named Serbia and Montenegro. In 2006 Montenegro and Serbia split peacefully into two separate countries. Two years later Serbia lost some of its territory when the province of Kosovo declared independence.

Yukon River

The Yukon River flows through large areas of wilderness on its way to the Bering Sea.

The Yukon River flows through the Yukon territory in Canada and the U.S. state of Alaska. It is 1,980 miles (3,190 kilometers) long. The river flows in a northwestern direction starting in southern Yukon. In Alaska it turns toward the southwest. It empties into the Bering Sea.

Only plants and animals that can survive in a cold climate are found around the Yukon River. These include spruce and other evergreen trees in the mountain valleys and such animals as bears, caribou, moose, timber wolves, muskrats, weasels, and foxes.

Native Americans have lived along the river for thousands of years. European fur traders began to arrive in the 1800s. More outsiders came to the area after people discovered gold on the Klondike River in 1896. (The Klondike feeds into the Yukon in western Yukon.) However, most of the gold seekers did not stay. Today the population of the region is very small.

Yukon

Yukon is a territory of Canada located in the northwestern part of the country. The territory is a largely untouched wilderness with a very small population. The capital is Whitehorse.

Geography

Yukon borders Alaska (a U.S. state) on the west, British Columbia (a Canadian province) on the south, and the Northwest Territories (a Canadian territory) on the east. The Beaufort Sea (a part of the Arctic Ocean) lies to the north. Yukon is the ninth largest of Canada's 13 provinces and territories.

In Yukon, mountains surround a central plateau, or high, flat area. Mount Logan rises in the southwest. It is the highest

point in Canada. The Yukon River flows northwest through the territory. Yukon's climate is cool and dry. The land in the far north is tundra, a cold area with no trees.

People

About one fifth of the people of the territory are Native Americans. Most belong to groups in the Athapaskan language family. The rest of the people have European ancestors or mixed Native American and European roots. Most people speak English. Smaller groups speak French or various Native American languages.

Two thirds of the population lives in Yukon's capital and largest city, Whitehorse. Dawson and Watson Lake are the next-largest towns. Other communities in Yukon have populations of several hundred or less.

Economy

Mining is the most important industry in Yukon. The territory has one of the world's largest deposits of tungsten, a valuable metal. There are also deposits of lead, zinc, silver, and gold.

Tourism is important to the territory's economy, too. Most visitors come to see Yukon's wilderness. Many people hike, raft, or fish in Kluane National Park and other areas.

Yukon has unspoiled wilderness for campers to enjoy.

Fishing and the fur trade are other important activities. Fishers catch salmon, lake trout, whitefish, and other fishes. Trappers catch lynx, marten, Wolverines, foxes, muskrat, and beavers for their furs. Agriculture is only a small part of the economy.

History

The first people in the Yukon territory probably came from Asia between 60,000 and 10,000 years ago. Over time, these people's descendants developed the several Native American cultures of the area.

The area that is now Yukon was one of the last places in North America to be visited by non-native people. Explorers for a fur-trading group called the Hudson's Bay Company entered the region in about 1840. Great Britain had given this company the right to control trade in what is now western Canada. In 1870 the Hudson's Bay Company sold this land to the new country of Canada.

What is now Yukon then became a part of Canada's Northwest Territories.

In 1896 people discovered gold near the Klondike River, which feeds into the Yukon River. Thousands of people came to the Yukon area in the hope of getting rich. They built Dawson, which became the largest city in western Canada. However, the Klondike gold rush lasted only a few years.

Canada created the separate Yukon Territory in 1898. The Canadian government moved the capital from Dawson to Whitehorse in 1953. In 2003 the Yukon Territory's name was officially changed to Yukon.

Zambia

The country of Zambia sits between eight other countries in southern Africa. Zambia's capital is Lusaka.

Zambia shares borders with the Democratic Republic of the Congo, Tanzania, Malawi, Mozambique, Zimbabwe, Botswana, Namibia, and Angola. Most of the country is on a plateau, or raised area of land. Several river valleys cross the plateau.

Wooded areas and grasslands cover much of the plateau. Grasses grow around Zambia's swamps and lakes. National parks in Zambia protect elephants, lions, monkeys, zebras, giraffes, antelope, wolves, hyenas, and baboons.

Zambia has many different peoples, each with their own language. The Bemba and Tonga peoples form the largest groups. English is the language of government. About half of the people fol-

low Christianity. Many people also practice African religions.

The mining of copper and other metals is very important to Zambia's economy. Most Zambians work as farmers. Major crops include sugarcane, cassava, corn, and vegetables. Farmers also raise cattle, goats, pigs, and chickens.

The ancestors of modern Zambians came to the area beginning in the 1400s. European settlers arrived in the mid-1800s. The British settlers called the area Northern Rhodesia. The British government took control of Northern Rhodesia in 1924.

In 1964 Northern Rhodesia gained independence. It was renamed as the Republic of Zambia. Zambia's first president ruled for almost 30 years.

The Zambezi River plunges over a cliff, forming a wide waterfall called Victoria Falls. The river forms part of the border between Zambia and Zimbabwe.

Zapata, Emiliano

The Mexican revolutionary leader Emiliano Zapata was ready to use his rifle or his sword.

Emiliano Zapata was one of the leaders of the Mexican Revolution. He fought against rich landowners who had taken land away from peasants, or poor farmers. He wanted to return the land to the peasants.

Zapata was born on August 8, 1879, in Anenecuilco, Mexico. His parents were peasants. As a young man Zapata saw his neighbors lose their land to the owners of large farms. He led his neighbors in protests against the landowners. Officials punished him by making him serve in the army for six months. After leaving the army Zapata gathered a group of peasant fighters. They took land back from the landowners by force.

Zapata also opposed Porfirio Díaz, the president of Mexico. Díaz did nothing

to help the peasants. In 1910 Zapata and others started the Mexican Revolution. By 1911 they had forced Díaz from power. A leader named Francisco Madero took his place.

Even after Díaz was gone, Zapata did not think Mexico's leaders did enough for the peasants. A general named Victoriano Huerta took power from Madero in 1913. Zapata disliked Madero, but he refused to help Huerta. This weakened Huerta, who lost power in 1914. Venustiano Carranza was the next leader of Mexico. Zapata disliked Carranza also. For a short time in 1914, Zapata's army controlled Mexico City, the capital.

Then Zapata joined forces with Pancho Villa, another revolutionary leader. They worked together to hand out pieces of land to peasants. Meanwhile, the war against the government continued. Carranza's forces defeated Villa in 1917. They shot and killed Zapata on April 10, 1919, in Morelos, Mexico.

Zebra

Zebras are mammals that are known for their black and white stripes. They belong to the horse family of animals. There are three species, or types, of zebra: Burchell's zebra, Grevy's zebra, and the mountain zebra. They live in various parts of Africa.

Zebras look similar to horses. They stand between 47 and 55 inches (120

and 140 centimeters) tall at the shoulder. Each species of zebra has its own pattern of stripes. Burchell's zebra has broad stripes that are widely spaced. The stripes of Grevy's zebra are narrow and closely spaced, and the belly is white. The mountain zebra has a gridlike pattern of stripes on the rump.

Zebras eat mostly tall, rough grasses. Some types also eat shrubs, herbs, and bulbs. Zebras communicate with each other using calls and facial expressions. They often greet each other with nose-to-nose contact.

Female zebras may have one foal each year. Females and their young usually live in small family groups headed by one male. But female Grevy's zebras may form family groups without head males. Family groups sometimes join together in larger herds. Zebras also may form mixed herds with antelope.

Both Grevy's and mountain zebras are endangered, or in danger of dying out. People are trying to save zebras by breed-

ing them in captivity and then releasing them into the wild.

Zapotec

The Zapotec are a group of American Indians who live in the state of Oaxaca in southern Mexico. Many Zapotec are farmers.

The Zapotec have lived in what is now Oaxaca since about 1500 BC. In about 500 BC they built a capital known as Monte Albán. This city had flat pyramids, temples, and elaborate tombs.

Like the Zapotec today, the early Zapotec were farmers. They also made fine pottery. In addition, they carved writings onto slabs of stone. This was some of the earliest writing in the Americas.

Zapotec lands once stretched from what is now Puebla (the state north of Oaxaca) to the Pacific Ocean. But after about AD 500 Monte Albán began to fall into ruin. A people called the Mixtec took over the city. The Zapotec later formed a number of small kingdoms. In the 1500s Spanish conquerors took over the region.

Did You Know?

Zapotec in different villages sometimes speak different Zapotecan languages.

Zebras generally live in small groups.

Zeus

The most powerful god in ancient Greek mythology was Zeus. He was considered

According to Greek mythology, Zeus ruled over all the other gods as well as humans.

the ruler of all the other gods as well as of humans. Zeus was said to live on top of Mount Olympus with the other

major gods. From there, he could see everything that humans did. He sent thunder, lightning, rain, and winds down to Earth. Zeus is associated with the Roman god Jupiter because they shared many traits. Two of Zeus's symbols are the thunderbolt and the eagle. He used the thunderbolt as a weapon.

Zeus was said to punish those who angered him or did wrong. However, he rewarded those who behaved well. Zeus also was the protector of cities, the home, property, strangers, and guests.

According to legend, Zeus was the son of the Titans Cronus and Rhea. The Titans were giants who once ruled the world. Cronus heard that one of his children would destroy him. To prevent this, he swallowed his children right after they were born. But when Zeus was born, Rhea tricked Cronus. She had him swallow a rock wrapped in cloth rather than the baby. Rhea secretly sent Zeus to a cave to live. After he grew up, Zeus led a war to force the Titans from power. After 10 years Zeus won and became the chief god.

Zeus's wife was the goddess Hera. They had a stormy relationship. Zeus fell in love with many other goddesses and women, and Hera became very jealous. Zeus was the father of many children, including the gods Apollo and Ares and the goddesses Artemis and Athena. Athena was born from Zeus's forehead.

Zimbabwe

Matusadona National Park is home to many animals, including herds of buffalo. The park lies along Lake Kariba in northern Zimbabwe.

Zimbabwe is a country in southern Africa. The British once ruled the land and called it Southern Rhodesia. A white government later called it just Rhodesia. Zimbabwe gained independence under a black government in 1980. The capital is Harare.

Geography

Zimbabwe shares borders with Zambia, Mozambique, South Africa, and Botswana. The country has a mild climate with dry and rainy seasons.

Zimbabwe lies on a plateau, or area of raised land. A ridge called the Highveld stretches from southwest to northeast. The Inyanga Mountains form Zimbabwe's eastern border. A line of hills, called the Great Dyke, runs from north to south through the middle of the country.

The Zambezi River forms Zimbabwe's border with Zambia. This river contains Victoria Falls, a huge waterfall. A major dam on the river created Lake Kariba.

Plants and Animals

Savanna, or grassland with scattered trees, covers much of Zimbabwe. Ever-green forests grow in the east. The country's animals include lions, hyenas, jackals, elephants, hippopotamuses, giraffes, gorillas, chimpanzees, baboons, antelope, and crocodiles.

People

Almost all of Zimbabwe's population is African. The main African groups are the Shona and the Ndebele. Europeans make up a tiny part of the population. English is the language of government, but the Shona and Ndebele languages are more commonly spoken. They belong to a large family of African languages called Bantu languages. About

half of the people follow Christianity. Many people also follow traditional African beliefs. Most people live in rural areas.

Economy

Zimbabwe's economy depends on agriculture. The most important crop is tobacco, which Zimbabwe sells to other countries. Other major crops include cotton, corn, and sugarcane. Farmers also raise cattle, goats, sheep, and pigs.

Mining is also important to the economy. Zimbabwe mines gold, nickel, coal, and other minerals in the hills of the Great Dyke. Zimbabwe's industries make food products, metals, clothing, chemicals, and wood products.

Facts About ZIMBABWE

Population
(2008 estimate)
11,350,000

Area
150,872 sq mi
(390,757 sq km)

Capital
Harare

Form of government
Republic

Major cities
Harare, Bulawayo, Chitungwiza, Mutare, Gweru

History

Some of the earliest people in the region were the San, or Bushmen. Bantu-speaking peoples came from the north between the AD 400s and 900s. They drove out the San.

Great Zimbabwe

The Bantu speakers built a city of stone in the southeast. It was the center of a rich trading empire from about 1100 to about 1500. The stone ruins at the site are called Great Zimbabwe. *Zimbabwe* is a Bantu word meaning “stone houses.”

Rhodesia

During the 1800s whites from South Africa and other Europeans settled on the land. In 1889 an Englishman named Cecil Rhodes formed the British South

Africa Company to start a colony and encourage trade. By 1897 the company controlled the region. The British called the land Southern Rhodesia in honor of Rhodes.

In 1923 Southern Rhodesia became a self-governing British colony. Even though most of the people of the colony were black, a small group of white people held all the power. In 1953 Southern Rhodesia joined with Northern Rhodesia (now Zambia) and Nyasaland (now Malawi) to form the Central African Federation. The federation broke up in 1963. Zambia and Malawi gained independence, but Southern Rhodesia went back to being a colony. In 1964 the colony was renamed Rhodesia.

Independence

In 1965 Rhodesia's white government tried to declare independence from Great Britain. Black leaders in Rhodesia soon formed groups that attacked the white government. After years of fighting, the government allowed blacks to vote in elections in 1979.

Black leaders won more elections in 1980. Rhodesia became the independent country of Zimbabwe. One of the black leaders, Robert Mugabe, became Zimbabwe's first prime minister. Mugabe became president in 1987. He held power into the 21st century. In 2000 his government began taking land away from white farmers.

Great Zimbabwe • Harare

Zodiac

A chart shows the 12 signs of the zodiac.

The zodiac is a belt of space around Earth. It occupies the path that the sun appears to take around Earth in the course of a year (although it is actually Earth that is moving around the sun).

Twelve well-known groups of stars, called constellations, lie in the zodiac. Their names are Aries (the ram), Taurus (the bull), Gemini (the twins), Cancer (the crab), Leo (the lion), Virgo (the virgin), Libra (the balance), Scorpius (the scorpion), Sagittarius (the archer), Capricornus (the goat), Aquarius (the water bearer), and Pisces (the fish).

Ancient peoples saw how the sun appeared to pass in front of each constellation for about one month of the year. (During this time the constellation was not visible in the night sky.) Most of the constellations represent animals. Therefore the ancient Greeks called the zone *zodiakos kyklos*, “circle of animals,” or *ta zodia*, “the little animals.”

Each sign was associated with specific dates. The dates have changed because the path of Earth has changed over the years. Astrologers still use the old dates. Astrologers are people who claim to be able to predict the future based on the positions of the stars and the planets in the sky.

Zoo

A zoo is a place where animals are kept and shown to visitors. Zoos give people the chance to see animals that they might not see anywhere else.

How Zoos Display Animals

In most zoos the animals are kept in houses. Sometimes the houses are connected to fenced-in outdoor spaces. Animals that live peacefully together in nature are sometimes put together in displays. Cages, fences, and other barriers

Visitors to the San Diego Zoo walk through a glass-walled exhibit called the Hidden Jungle. There they see a variety of butterflies, birds, insects, and plants.

A zookeeper feeds a California condor chick that will be set free when it is grown. The keeper hides behind a puppet so that the bird will not lose its fear of humans. Many zoos try to help endangered animals like the California condor.

ers keep the animals from escaping. The barriers also keep zoo visitors from getting too close to the animals.

Zoos usually try to make the animals' surroundings look like natural habitats. Plants, trees, rocks, and other things animals would see in nature are included in the displays. Often these things are artificial instead of natural. Inside zoo buildings, light and temperature are set to the liking of the animals. For example, animals that are active at night are kept in buildings that are dark during the day and lighted at night.

Open-range zoos are large, outdoor zoos. In these zoos animals are kept in more natural conditions. Many open-space zoos have displays with just one type of animal, such as a group of lions. Others have displays with mixed groups

of animals. Some open-range zoos are so large that visitors can drive through in cars.

Purposes of Zoos

Zoos have a number of purposes. They try to teach visitors about the habitats and behavior of animals. They also work to protect endangered species, which are animals that are in danger of dying out in the wild. Some zoos help endangered animals to reproduce. Sometimes the animals are then returned to the wild.

History

Zoos date back to ancient times. Rulers of ancient China, Egypt, Greece, and Rome kept collections of animals. Some of these zoos were private. Others were open to the public. In the 1700s zoos were set up in major cities of Europe, including Vienna, Austria; Madrid, Spain; and Paris, France. By the middle of the 1800s zoos were being opened all over the world. Today there are more than 1,000 zoos.

Zoology

Zoology is the study of animal life. Scientists who work in this field are called zoologists. They study all different kinds of animals, from tiny amoebas to humans to giant whales.

Zoology is divided into many different areas. The name of each is based on the group of animals that is studied. For

A zoologist goes underwater to study a mammal called a manatee.

example, entomology is the study of insects and mammalogy is the study of mammals.

Some zoologists examine animals' bodies and how they live. They may answer questions about how the animals behave, how their bodies work, or how they live in their environment. Other zoologists study how animals have evolved, or changed, over time. One of the greatest zoologists was Charles Darwin. He developed the theory of evolution.

Zoologists often study animals in the wild. They may also take animals back to a lab to study them more closely. They may draw or photograph the animals or look at them under a microscope.

Some zoologists study animals that are extinct, or no longer living. They may look at fossils, or remains, of extinct animals. Living relatives of extinct animals may also help zoologists understand how animals lived long ago.

Zoroastrianism

The religion known as Zoroastrianism was founded in the 500s BC by an Iranian named Zoroaster. Most followers of the religion live in India. There the religion is known as Parsiism.

Zoroastrians believe the world is involved in a struggle between good and evil. They worship one supreme god, Ahura Mazda, the creator of the world and all good things. Evil is represented by Ahriman, creator of all bad things. Zoroastrians believe that in the end all evil will be destroyed. They are expected to turn away from evil. Giving to others and being truthful are important.

Children become Zoroastrians at age 7 or 10. They receive two sacred garments, a *sadre* (shirt) and *kusti* (girdle). They are to wear these garments through their whole lives.

Zoroastrian priests perform a ceremony to bring a child into the Zoroastrian religion.

Fire is an important symbol in Zoroastrianism. Followers of the religion say prayers every day, often in front of a fire. The main ceremony involves sacrificing a sacred liquor while reading from a sacred book called the Avesta. Zoroastrians also perform cleansing rituals to keep away evil spirits.

Zoroastrianism spread slowly from Persia (now Iran) to other countries. It became the official religion of Persia in AD 224. Eventually, Islam took over as the major religion there. Most Zoroastrians left Persia to settle in India. Today, followers of Zoroastrianism live in about 20 countries.

Zuni

The Zuni are Native Americans of western New Mexico. They are one of a group of tribes known as Pueblo Indi-

A Zuni potter makes a pot from coils, or long ropes, of clay in the early 1900s.

ans. They live in a pueblo, or village, that is also named Zuni. They call themselves Ashiwi.

Like other Pueblo Indians, the Zuni traditionally built large houses with several stories. They built the houses out of blocks of sun-baked clay, called adobe. The Zuni grew corn, squash, beans, and sunflowers. They also fished and hunted deer, antelope, and other animals.

In 1539 a black slave named Estéban arrived in Zuni lands. He had come from Mexico with a Spanish priest named Marcos de Niza. Niza was looking for the Seven Cities of Cíbola, famed cities of great wealth that did not actually exist. Niza sent Estéban ahead to meet the Zuni. The Zuni killed Estéban, and Niza went back to Mexico. He announced that he had found the Seven Cities. Then other Spanish explorers went through Zuni lands looking for the cities. The most famous of the explorers was Francisco Coronado.

In 1680 the Zuni joined in a Pueblo rebellion against the Spanish. The Pueblo drove the Spanish from their territory for 12 years. When the Spanish returned, they crowded all of the Zuni into one village, called Halona. That is where Zuni Pueblo still stands. At the end of the 20th century there were more than 9,000 Zuni.

How to Use the Britannica Student Encyclopedia Index

The index can help you find information in several different ways.

If you know the name of the subject you want to read about, you can look up that name. If the encyclopedia has an article on that subject then the index will tell you the volume and page number where you will find that article.

exercise (physical activity)

MAIN ARTICLE *volume 4 page 171*

Sometimes other articles also have information about that subject. The index will tell you when there is more information about a topic in another article.

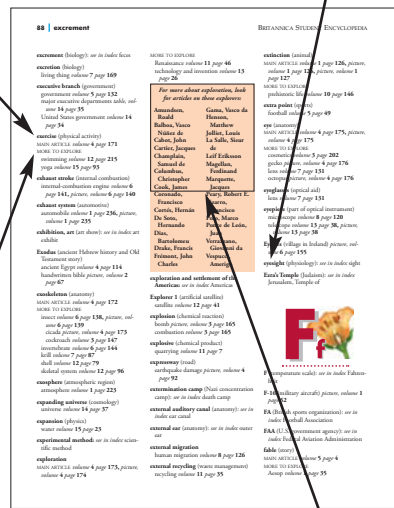

MORE TO EXPLORE

swimming *volume 12 page 215*
yoga *volume 15 page 93*

Sometimes the encyclopedia has information on the subject, but it is under a different name. The index will tell you what name to look under.

eyesight (physiology): *see in index sight*

The index also has many tables that can help you find a subject. For example, if your teacher asks you to do a report on a famous African American you can look up “African American” in the index. You will find a table that lists some famous African Americans. The encyclopedia has an article on each name in that list. There are more than 30 subject lists throughout the index. They include lists of every country on each continent as well as lists of science topics, arts, world leaders, and many more.
